Soil Survey of Redwood National and State Parks, California

How To Use This Soil Survey

General Soil Maps

The general soil maps, which are color maps, show the survey area divided into groups of associated soils called general soil map units. These maps are useful in planning the use and management of large areas.

To find information about your area of interest, locate that area on the maps, identify the name of the map unit in the area on the color-coded map legend, then refer to the section **General Soil Map Units** for a general description of the soils in your area.

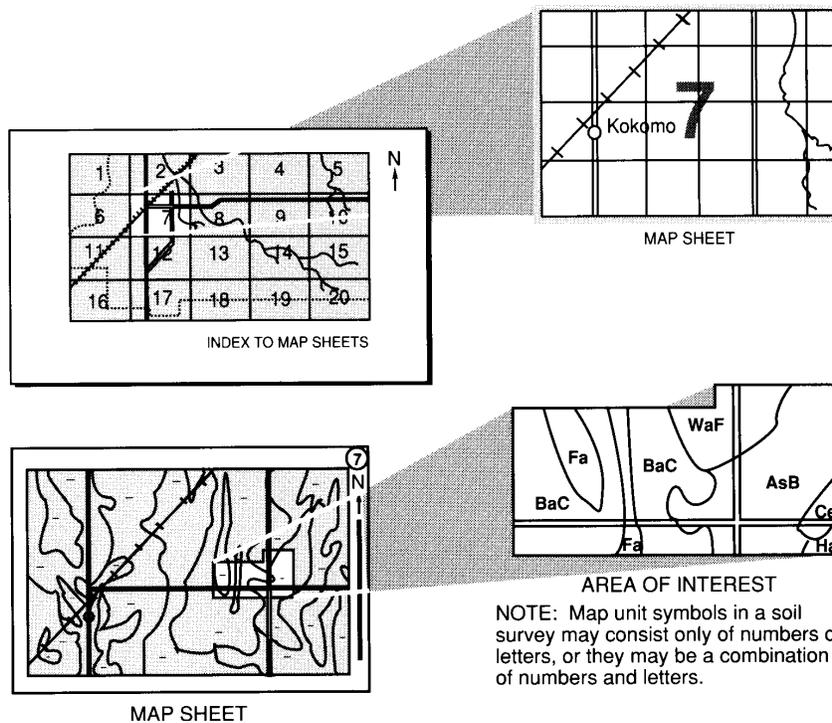

Detailed Soil Maps

The detailed soil maps can be useful in planning the use and management of small areas.

To find information about your area of interest, locate that area on the **Index to Map Sheets**. Note the number of the map sheet and turn to that sheet.

Locate your area of interest on the map sheet. Note the map unit symbols that are in that area. Turn to the **Contents**, which lists the map units by symbol and name and shows the page where each map unit is described.

The **Contents** shows which table has data on a specific land use for each detailed soil map unit. Also see the **Contents** for sections of this publication that may address your specific needs.

National Cooperative Soil Survey

This soil survey is a publication of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (formerly the Soil Conservation Service) has leadership for the Federal part of the National Cooperative Soil Survey. This survey was made cooperatively by the Natural Resources Conservation Service and the California Department of Parks and Recreation; the California Department of Forestry; Humboldt State University; and the United States Department of the Interior, National Park Service and Bureau of Land Management. The survey is part of the technical assistance furnished to the Redwood National and State Parks.

Major fieldwork for this soil survey was completed in 2005. Soil names and descriptions were approved in 2006. Unless otherwise indicated, statements in this publication refer to conditions in the survey area in 2005. The most current official data are available on the Internet.

Soil maps in this survey may be copied without permission. Enlargement of these maps, however, could cause misunderstanding of the detail of mapping. If enlarged, maps do not show the small areas of contrasting soils that could have been shown at a larger scale.

Nondiscrimination Statement

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

Foreword

This soil survey contains information that affects land use planning in this survey area. It contains predictions of soil behavior for selected land uses. The survey also highlights soil limitations, improvements needed to overcome the limitations, and the impact of selected land uses on the environment.

This soil survey is designed for many different users. Farmers, ranchers, foresters, and agronomists can use it to evaluate the potential of the soil and the management needed for maximum food and fiber production. Planners, community officials, engineers, developers, builders, and home buyers can use the survey to plan land use, select sites for construction, and identify special practices needed to ensure proper performance. Conservationists, teachers, students, and specialists in recreation, wildlife management, waste disposal, and pollution control can use the survey to help them understand, protect, and enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. The information in this report is intended to identify soil properties that are used in making various land use or land treatment decisions. Statements made in this report are intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are shallow to bedrock. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

These and many other soil properties that affect land use are described in this soil survey. Broad areas of soils are shown on the general soil maps. The location of each map unit is shown on the detailed soil maps. Each soil in the survey area is described. Information on specific uses is given for each soil. Help in using this publication and additional information are available at the local office of the Natural Resources Conservation Service or the Cooperative Extension Service.

General Nature of the Survey Area

This section provides general information about the survey area. It describes history and settlement; physiography, relief, drainage; and climate.

The survey area consists of the Redwood National and State Parks and the Lower Park Protection Zone (fig. 1). The Redwood National and State Parks are comprised of five units: Redwood National Park, established in 1968 and expanded in 1978; Prairie Creek Redwoods State Park, established in 1923; Del Norte Coast Redwoods State Park, established in 1925; Jedediah Smith Redwoods State Park, established in 1929; and the Mill Creek and Rock Creek watershed, acquired in 2003. The Lower Park Protection Zone consists of private lands where the landowners have entered into partnership with the National Park Service to minimize erosion and stream sedimentation. The Lower Park Protection Zone was established in 2001.

The survey area is along the coast in the northwestern part of California (fig. 2). The area is bounded on the west by the Pacific Ocean, on the north by the Smith River and private land, on the east by Six Rivers National Forest and private land in Humboldt and Del Norte Counties, and on the south by private land in Humboldt County. The survey area is approximately 161,933 acres. It is 60 miles in length and varies from 0.5 to 8 miles in width. Elevation ranges from sea level along Gold Bluffs beach to 3,262 feet (994 meters) at an unnamed summit south of Coyote Peak.

Figure 1.—Location of the survey area in California.

The coastal town of Crescent City is the largest community adjacent to the survey area. Crescent City is home to the Redwood National Park Headquarters. The population of the city was approximately 4,000 in 2000.

Most of the survey area consists of strongly sloping to very steep mountains that are used for watershed, wildlife habitat, and recreation. Past land uses in the mountainous areas included timber production and livestock grazing. The southern coastal areas, near the town of Orick, consist of nearly level to moderately steep, nonmarine and marine terraces that are also used for watershed, wildlife habitat, and recreation. Past land uses in the coastal areas also included timber production and livestock grazing.

Previous soil surveys, inventories, and studies have been published regarding portions of the survey area. This survey maps all lands within the current boundaries of the parks and associated areas using contemporary standards of the National Cooperative Soil Survey (Soil Survey Staff, 2001).

The first soil survey in northwestern California was by Watson, Cosby, and Smith (1925) and covered the Eureka area. Although fragmentary by modern standards, the

Figure 2.—View of the rugged coastline near False Klamath Cove and the Pacific Ocean. Pictured are areas of Sisterrocks-Sasquatch-Houda complex, 30 to 75 percent slopes, dominated by Sitka spruce and red alder; Flintrock-Highprairie complex, 15 to 75 percent slopes, dominated by coastal scrub and prairie; and on ridges farther inland, areas of Sasquatch-Yeti-Footstep complex, 5 to 30 percent slopes, covered by redwood and Douglas-fir.

soil descriptions are adequate for the recognition of series concepts based on major diagnostic horizons and particle-size classes. The map units adequately characterize typical conditions, variability, and inclusions.

The “California Cooperative Soil-Vegetation Survey” (Alexander and others, 1952–1978) mapped the upland soils of northwestern California on the basis of USGS quadrangles. This survey remains a primary source of soil information for most lands within the parks and associated lands of interest. The “Soils of Coastal Del Norte County, California” (McLaughlin and Harradine, 1966) and “Soils of Western Humboldt County, California” (McLaughlin and Harradine, 1965) effectively describe the soils, map units, and taxonomic units in a standard format for alluvial and terrace soils in the investigated areas.

In addition to the previous soil surveys and inventories, several specialized studies provide pertinent background data for this publication. Investigations in the Redwood Creek Basin, Redwood National Park, Bald Hills prairies, and Bond Creek subbasin have included determinations of clay mineralogy and particle-size distribution, studies of soil properties related to specific serial vegetation interpretations, and laboratory characterizations of soil properties (Winzler and Kelly, 1975; Ficklin, Harward, and Youngblood, 1977; Durgin and Tackett, 1981; Gordon, 1980; Hauxwell, Bulkin, and Hanson, 1981; Muldavin and others, 1981; Marron, 1982; Popenoe, 1982; Veirs, 1982; Begg and others, 1984; Marron, 1985; Popenoe, 1985; Marron and Popenoe, 1986; Popenoe, 1987; Popenoe, 1990; Popenoe and others, 1992; and Popenoe, 1998). Relevant independent studies and National Park Service studies began around 1975 and continue today.

History and Settlement

The archeological pattern of pre-European settlement in the survey area indicates a record of approximately 4,500 years of continuous habitation. From 4,500 y.b.p. (years before present) to 2,800 y.b.p., cultural practices consisted mainly of hunting and gathering by small, highly mobile family groups. The primary food sources were deer, elk, small game, and acorns and other edible seeds. From 2,800 y.b.p. to 1,100 y.b.p. increased population and migration from other areas, primarily the Pacific Northwest, led to the development of new food-storage technology, which allowed for the development of more permanent village sites near salmon bearing streams and near harvestable seed crops, such as acorns. From 1,100 years y.b.p. to the time of European contact in the early 1800s, numerous permanent tribal settlements were located in the coastal zone and along low-elevation waterways. There was an extensive trade network among coastal villages and inland regions through the rugged, densely forested interior (USDI, 1999).

Prior to European contact, the uplands, streams, and coastal areas were important fishing, hunting, and gathering areas for the Yurok, Tolowa, Chilula, and others. Principal settlements were along the coast, coastal lagoons, rivers, creeks, and major ridges.

In 1579, English explorer Francis Drake may have been the first European to look upon the Humboldt Coast. There is, however, no evidence that Drake and his crew came ashore. The Spanish made other sea expeditions to the Humboldt coast in the late 1700s. In 1775, Juan Francisco de la Bodega y Quadra claimed the port of Trinidad. Around 1800, trade in sea otter furs attracted American, Russian, and British explorers. The fur trade led to an American effort to chart Humboldt Bay in 1806 (USDI, 1999).

In 1828, Jedediah Smith led the first successful overland expedition to the rugged, densely forested mountains of northwestern California. The expedition made its way to the coast near the area that would become Crescent City before heading north. In 1848, gold was discovered by Major Pierson B. Redding in the upper Trinity basin. The discovery triggered the north-coast gold rush, which resulted in a mass migration of miners and traders to the area. Crescent City, Eureka, Arcata, and other smaller communities were established as supply centers for gold miners. Farmers and ranchers soon followed. Dairy farms and commercial fisheries were established in the late 1800s. The timber industry was established around the turn of the century. It became the main means of economic sustenance and growth until the 1970s (USDI, 1999).

Physiography, Relief, and Drainage

The survey area is primarily in the California Coast Range. The area consists of tectonically active, steep and very steep, northwest-trending mountains and hills. The intricately dissected drainage basins are characterized by high relief, steep and very steep, unstable mountain slopes and hillslopes. The basins comprise about 90 percent of the survey area and are composed primarily of sandstone, mudstone, and schist of the Franciscan assemblage and weakly consolidated marine and fluvial sediments of the Prairie Creek Formation. Narrow valleys are between mountain ridges and hillcrests. The valley floors are recent alluvium.

Numerous nearly level, marine and nonmarine terraces, beaches, secluded coves, lagoons, and vertical cliffs characterize the near-coast portion of the survey area.

Much of the survey area is located along the lower, downstream sections of the Klamath River, Smith River, and Redwood Creek and their tributaries (fig. 3). The steep and very steep forested uplands in the area receive large amounts of winter precipitation, primarily as rain. The large amounts of winter precipitation, tectonically active landscape with numerous major faults (Grogan, Lost Man, South Fork Mountain,

Figure 3.—Strongly sloping areas covered by redwood and Douglas-fir. Such areas dominate the landscape throughout the Redwood Creek watershed. Pictured are areas of Coppercreek-Slidecreek-Lackscreek complex, 30 to 50 percent slopes, which are underlain by sandstone and mudstone (to the right of Redwood Creek); Coppercreek-Ahpah-Lackscreek complex, 30 to 50 percent slopes and Trailhead, 15 to 30 percent slopes, which are underlain by schist (to the left of Redwood Creek); and areas of Surpur, 2 to 9 percent slopes, on uplifted marine terraces (in background).

and Coastal thrust), steep terrain, and medium textured soils are major contributing factors to high erosion rates (Weaver, Kelsey, and Madej, 1979; Harden and others, 1982).

A very small portion of the survey area is in the Klamath Mountains. The area is made up of very steep mountain ridges composed of metamorphosed sedimentary, ultramafic, and mafic rocks.

Climate

Mild temperatures, rainy winters, and nearly rainless but foggy summers characterize the climate of the survey area. The Pacific Ocean produces a moderating effect, which diminishes eastward. The more inland areas, therefore, have colder winters and warmer summers. Marine fog is common in coastal areas, especially during the nearly rainless summer. The fog frequently moves inland up river and creek drainages (fig. 4) in the evening but usually burns off by midday. Fog reduces moisture stress on vegetation to the extent that fog drip may be an important source of water for redwood trees during the dry summer months.

Table 1 gives data on temperature and precipitation for the survey area as recorded at Orick Prairie Creek Redwoods State Park and Crescent City in the period 1948 to 2004. Table 2 shows probable dates of the first freeze in fall and the last freeze in spring.

In Prairie Creek Redwoods State Park, the average winter (December, January, and February) temperature is 45 degrees F and the average daily minimum winter temperature is 37 degrees F. The lowest temperature on record, which occurred on November 11, 2002, is 2 degrees F. In summer (June, July, and August), the average

Figure 4.—Coastal fog in the Redwood Creek watershed. Pictured are areas of Pasturerock-Coyoterock-Maneze complex, 30 to 50 percent slopes, dominated by oak woodlands; Dolason-Countshill-Airstrip complex, 9 to 30 percent slopes, dominated by prairie; Dolason-Countshill-Airstrip complex, 9 to 30 percent slopes, dominated by Douglas-fir invaded prairie; and Coppercreek-Slidecreek-Lacks creek complex, 30 to 50 percent slopes, covered by Douglas-fir and redwood.

temperature is 58 degrees F and the average daily maximum temperature is 68 degrees F. The highest recorded temperature, which occurred on June 6, 196, is 99 degrees F.

In Prairie Creek Redwoods State Park, the total annual precipitation is about 67.5 inches. Of this, 11.7 inches, or 17 percent, usually falls in April through September. The growing season for most crops falls within this period. In 2 years out of 10, the rainfall in April through September is less than 0.3 inch. The heaviest 1-day rainfall during the period of record was 11.5 inches on October 25, 1950. Thunderstorms occur on about 4 days each year and are most common from November through February.

In Crescent City, the average winter (December, January, and February) temperature is 48 degrees F and the average daily minimum winter temperature is 41 degrees F. In summer (June, July, and August), the average temperature is 58 degrees F and the average daily maximum temperature is 65 degrees F. The total annual precipitation is about 66 inches.

Growing degree days are shown in table 1. They are equivalent to "heat units." During the month, growing degree days accumulate by the amount that the average temperature each day exceeds a base temperature (40 degrees F). The normal monthly accumulation is used to schedule single or successive plantings of a crop between the last freeze in spring and the first freeze in fall.

Snowfall is rare throughout the survey area. In 90 percent of the winters, there is no measurable snowfall. In 10 percent, the snowfall, usually of short duration, is more than 0.5 inch. The heaviest 1-day snowfall on record was more than 6.5 inches.

The average relative humidity in midafternoon is about 65 percent. Humidity is higher at night, and the average at dawn is about 80 percent. The sun shines 55 percent of the time possible in summer and 43 percent in winter. The prevailing wind at Crescent City is from the south and southeast. Average windspeed is highest, 10.4 miles per hour, in February.

Additional climate information is available at <http://www.wrcc.dri.edu/summary>.

How This Survey Was Made

This survey was made in conjunction with the National Park Service's Soil Inventory and Monitoring Program to provide information about the soils and miscellaneous areas in Redwood National and State Parks. The information includes a description of the soils and miscellaneous areas and their location and a discussion of their suitability, limitations, and management for specified uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They dug many holes to study the soil profile, which is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

The soils and miscellaneous areas in the survey area are in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept or model of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are

Soil Survey of Redwood National and State Parks, California

modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

This survey area was mapped at two levels of detail. At the more detailed level, map units are narrowly defined. Map unit boundaries were plotted and verified at closely spaced intervals. At the less detailed level, map units are broadly defined. Boundaries were plotted and verified at wider intervals.

General Soil Map Units

The general soil maps in this publication show broad areas that have a distinctive pattern of soils, relief, and drainage. The map units on the general soil maps are unique natural landscapes. Typically, they consist of one or more major soils or miscellaneous areas and some minor soils or miscellaneous areas. They are named for the major soils or miscellaneous areas. The components of one map unit can occur in another but in a different pattern.

The general soil map can be used to compare the suitability of large areas for general land uses. Areas of suitable soils can be identified on the maps. Likewise, areas where the soils are not suitable can be identified.

Because of their small scale, the maps are not suitable for planning the management of a farm or field or for selecting a site for a road or building or other structure. The soils in any one map unit differ from place to place in slope, depth, drainage, and other characteristics that affect management.

Included in this section are block diagrams showing the distribution of general soil map units by watershed. Figure 5 is an index map showing the location and viewing angles of the diagrams.

Udic Soils on Hills, Beaches, and Dunes

1. *Sisterrocks-Sasquatch-Samoa, very deep, nearly level to very steep* (fig. 6)

Very deep, nearly level to very steep, well drained and somewhat excessively drained soils that have little seasonal fluctuation in soil temperature; that formed in residuum and colluvium derived from sandstone, mudstone, and marine sand on hillslopes, ridges, beaches, and dunes adjacent to the ocean; and that have a very strong influence from coastal fog

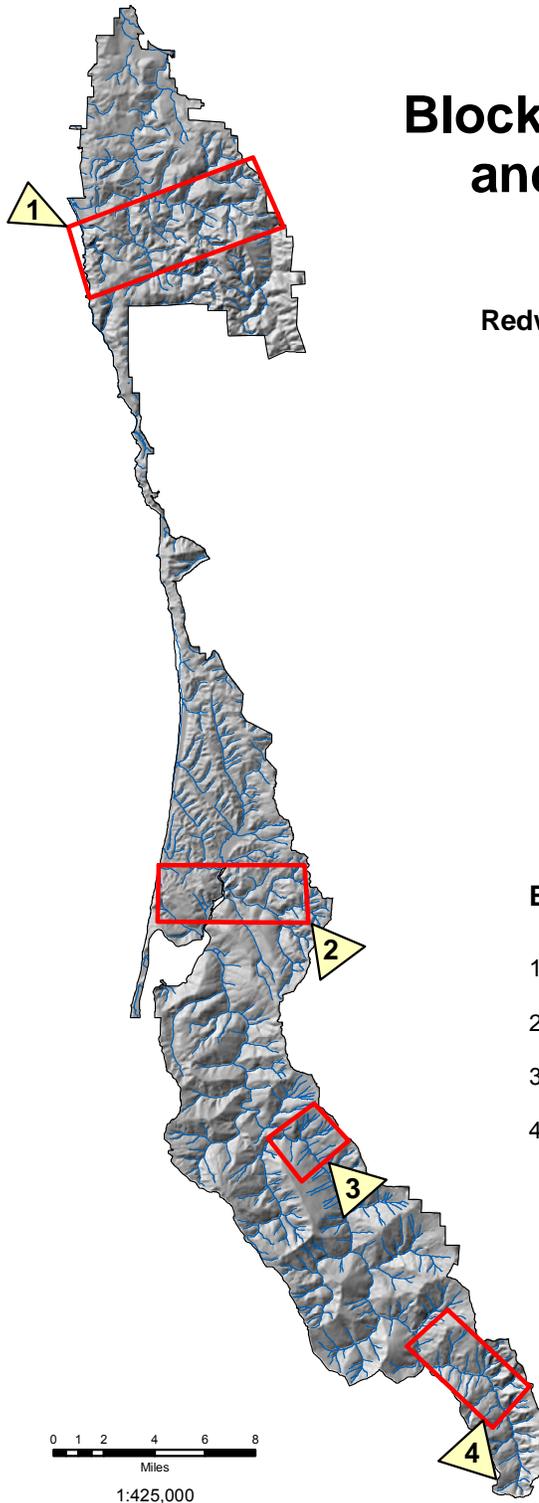

This map unit is on hillslopes, ridges, beaches, and dunes along the immediate coast from directly south of Orick to Crescent City. The vegetation is mainly Sitka spruce, red alder, western hemlock, and Douglas-fir with an understory dominated by deciduous shrubs or ferns or coastal grasses, forbs, and shrubs. Elevation ranges from sea level to 970 feet (0 to 295 meters). The average annual precipitation is 35 to 90 inches (89 to 2,300 millimeters), the average annual air temperature is 50 to 55 degrees F (10 to 13 degrees C), and the frost-free season is 250 to 365 days. A strong marine influence minimizes seasonal fluctuations in air temperature and soil temperature.

This unit makes up about 2 percent of the survey area. It is about 25 percent Sisterrocks and similar soils, 15 percent Sasquatch and similar soils, 15 percent Samoa and similar soils, and 45 percent soils of minor extent.

The Sisterrocks soils are very deep and well drained. Typically, the surface layer is gravelly loam. The subsoil is very gravelly clay loam or very gravelly loam. The

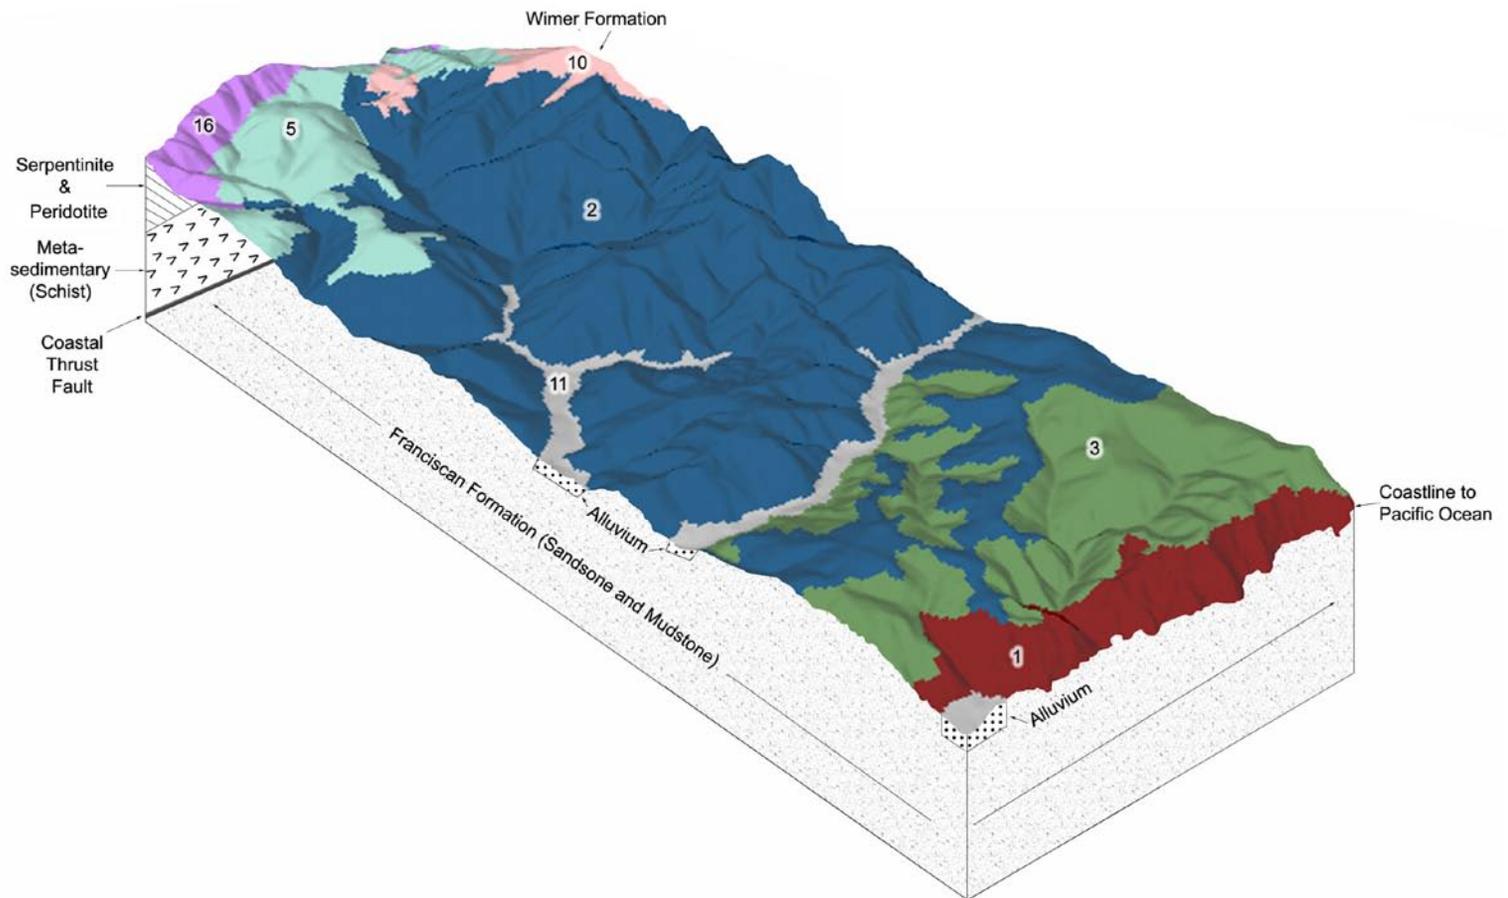

Figure 6.—Block diagram 1. Generalized pattern of soil distribution and conceptualized geology in the Mill Creek and Rock Creek watersheds viewed from the Pacific Ocean southeast towards Childs Hill and Rattlesnake Mountain.

substratum is very gravelly loam or very gravelly clay loam. Slopes range from 15 to 75 percent.

The Sasquatch soils are very deep and well drained. Typically, the surface layer is loam. The subsoil is clay loam or gravelly clay loam. Slopes range from 15 to 75 percent.

The Samoa soils are very deep and somewhat excessively drained. Typically, the surface layer is sand. The subsoil is gravelly sand. The substratum is gravelly sand or sand. Slopes range from 0 to 50 percent.

Of minor extent in this unit are Clambeach, Flintrock, Highprairie, Houda, and Yeti soils. Also included are areas of Beaches, Dune lands, and rock outcrop.

Most areas of this map unit were formerly used for timber production and are currently used for wildlife, recreation, and watershed.

The main management concerns are slope, seasonally saturated soil conditions, potential for mass wasting on unstable slopes, and low soil strength.

Udic Soils Derived from Sandstone and Mudstone on Mountains

2. Coppercreek-Slidecreek-Tectah, very deep, nearly level to very steep

Very deep, nearly level to very steep, well drained soils that have little seasonal fluctuation in soil temperature and that formed in residuum and colluvium derived from sandstone and mudstone; on mountain slopes and ridges

This map unit is on mountain slopes and ridges east of Redwood Creek and within the Lost Man, Mill, and Rock Creek watersheds. The vegetation is mainly redwood, Douglas-fir, western hemlock, red alder, and tanoak with an understory dominated by evergreen shrubs. Elevation ranges from 65 to 2,410 feet (20 to 735 meters). The average annual precipitation is 70 to 100 inches (1,780 to 2,540 millimeters), the average annual air temperature is 50 to 55 degrees F (10 to 13 degrees C), and the frost-free season is 240 to 290 days. A moderately strong marine influence minimizes seasonal fluctuations in air temperature and soil temperature.

This unit makes up about 20 percent of the survey area. It is about 40 percent Coppercreek and similar soils, 30 percent Slidecreek and similar soils, 15 percent Tectah and similar soils, and 15 percent soils and miscellaneous areas of minor extent.

The Coppercreek soils are very deep and well drained. Typically, the surface layer is loam. The subsoil is gravelly clay loam. The substratum is very gravelly clay loam. Slopes range from 0 to 75 percent.

The Slidecreek soils are very deep and well drained. Typically, the surface layer is gravelly loam. The subsoil is very gravelly clay loam. The substratum is extremely gravelly clay loam. Slopes range from 9 to 75 percent.

The Tectah soils are very deep and well drained. Typically, the surface layer is clay loam. The subsoil is clay loam or clay. Slopes range from 0 to 50 percent.

Of minor extent in this unit are Ahpah, Atwell, Lacks creek, and Trailhead soils. Also included are areas of rock outcrop.

Most areas of this map unit were formerly used for timber production and are currently used for wildlife, recreation, and watershed.

The main management concerns are slope, seasonally saturated soil conditions, potential for mass wasting on unstable slopes, and low soil strength.

3. Sasquatch-Sisterrocks-Ladybird, very deep, strongly sloping to very steep (fig. 7)

Very deep, strongly sloping to very steep, well drained soils that have little seasonal fluctuation in soil temperature; that formed in residuum and colluvium derived from sandstone and mudstone on hillslopes, mountain slopes, and ridges; and that have a strong influence from coastal fog

This map unit is on hillslopes, mountain slopes, and ridges along the coast from Orick to Crescent City. The vegetation is mainly redwood, Sitka spruce, western hemlock, Douglas-fir, red alder, and tanoak with an understory dominated by deciduous shrubs or ferns. Elevation ranges from 6 to 1,725 feet (2 to 525 meters). The average annual precipitation is 65 to 90 inches (1,650 to 2,300 millimeters), the average annual air temperature is 50 to 55 degrees F (10 to 13 degrees C), and the frost-free season is 250 to 300 days. A strong marine influence minimizes seasonal fluctuations in air temperature and soil temperature. Furthermore, a persistent fog layer reduces evapotranspiration and increases overall soil moisture and plant-available water.

This unit makes up about 11 percent of the survey area. It is about 45 percent Sasquatch and similar soils, 25 percent Sisterrocks and similar soils, 15 Ladybird and similar soils, and 15 percent soils of minor extent.

The Sasquatch soils are very deep and well drained. Typically, the surface layer is gravelly loam. The subsoil is gravelly clay loam. The substratum is also gravelly clay loam. Slopes range from 9 to 50 percent.

The Sisterrocks soils are very deep and well drained. Typically, the surface layer is gravelly loam. The subsoil is very gravelly clay loam. The texture of the substratum ranges from very gravelly loam to extremely gravelly clay loam. Slopes range from 30 to 75 percent.

The Ladybird soils are very deep and well drained. Typically, the surface layer is gravelly loam. The subsoil is gravelly clay loam or gravelly silty clay loam. The substratum is very gravelly loam. Slopes range from 30 to 75 percent.

Of minor extent in this unit are Footstep and Yeti soils. Also included are areas of rock outcrop.

Most areas of this map unit were formerly used for timber production and are currently used for wildlife, recreation, and watershed.

The main management concerns are slope, seasonally saturated soil conditions, potential for mass wasting on unstable slopes, and low soil strength.

4. Atwell-Coppercreek, very deep, moderately steep and steep

Very deep, moderately steep and steep, moderately well drained and well drained soils that have little seasonal fluctuation in soil temperature and that formed in earthflow colluvium from sheared mudstone and sandstone; on irregular mountain slopes shaped by mass wasting

This map unit is on wet, irregular mountain slopes east of Redwood Creek. The vegetation is mainly redwood, red alder, tanoak, and Douglas-fir. Elevation ranges from 145 to 2,460 feet (45 to 750 meters). The average annual precipitation is 70 to 90 inches (1,780 to 2,300 millimeters), the average annual air temperature is 50 to 55 degrees F (10 to 13 degrees C), and the frost-free season is 250 to 290 days. A moderately strong marine influence minimizes seasonal fluctuations in air temperature and soil temperature.

This unit makes up about 2 percent of the survey area. It is about 50 percent Atwell and similar soils, 35 percent Coppercreek and similar soils, and 15 percent soils and miscellaneous areas of minor extent.

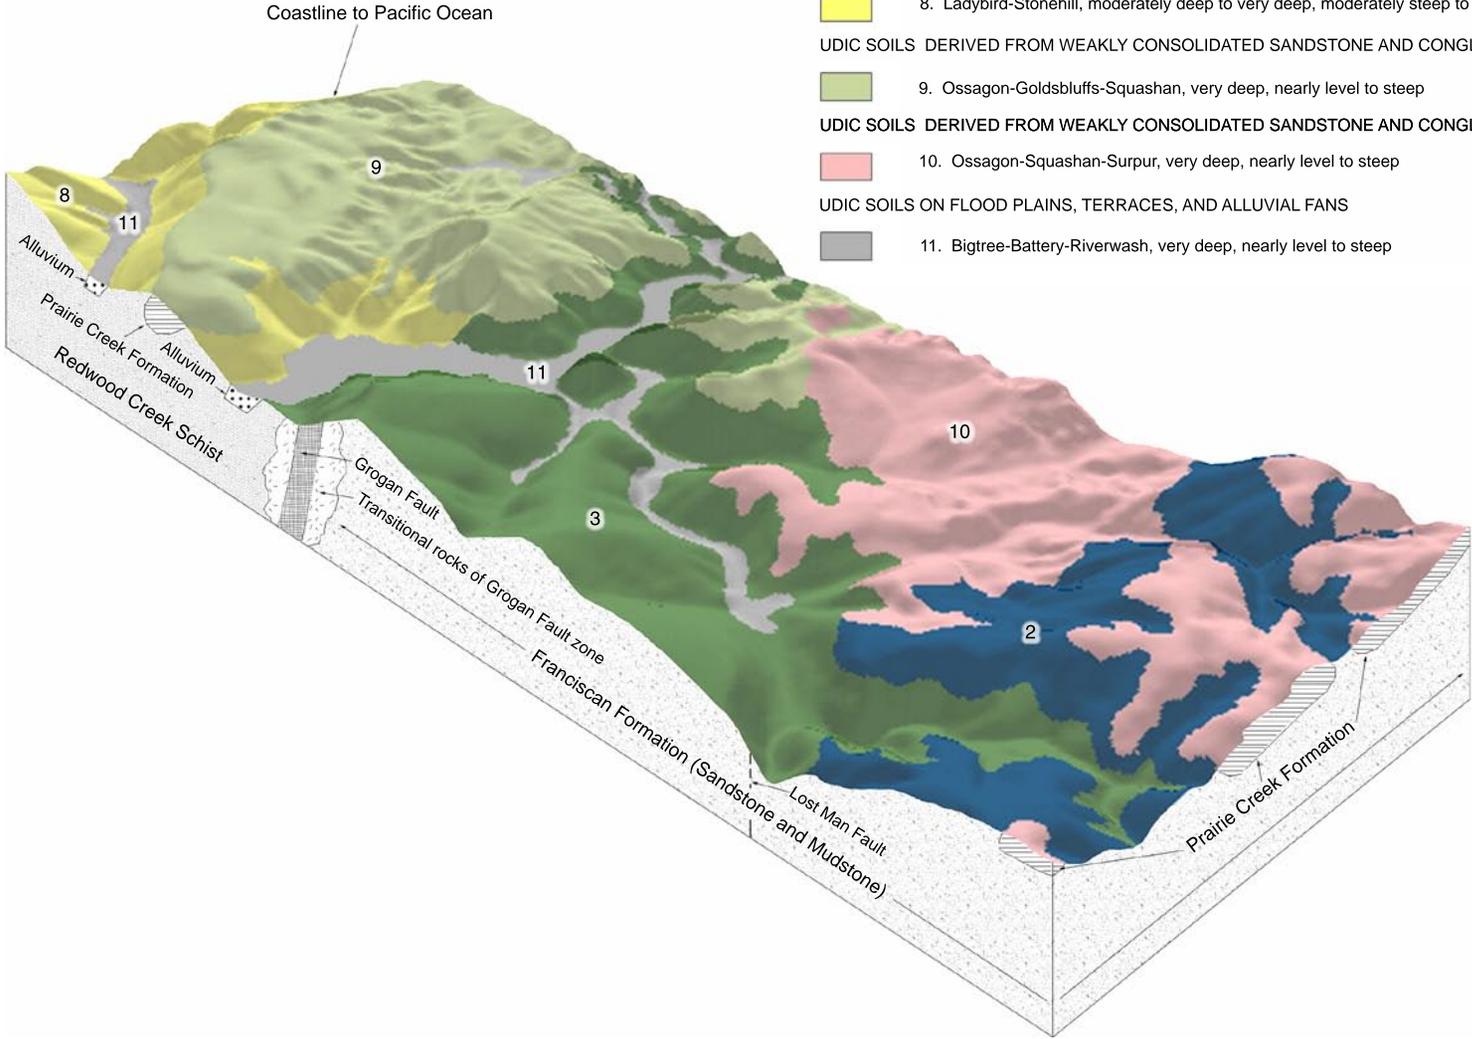

Figure 7.—Block diagram 2. Generalized pattern of soil distribution and conceptualized geology in the Lost Man, May, and Prairie Creek watersheds viewed from Holter Ridge area northwest towards Gold Bluffs beach and the Pacific Ocean.

The Atwell soils are very deep and moderately well drained. Typically, the surface layer is clay loam. The subsoil is gravelly clay loam or gravelly clay. The substratum is gravelly clay. Depth to the seasonal high water table ranges from 50 to 100 centimeters (20 to 40 inches). Slopes range from 30 to 50 percent.

The Coppercreek soils are very deep and well drained. Typically, the surface layer is loam. The subsoil is clay loam or gravelly clay loam. The substratum is silty clay loam or clay. Slopes range from 30 to 50 percent.

Of minor extent in this unit are Lacks creek, Ladybird, Panthercreek, and Slidecreek soils.

Most areas of this map unit were formerly used for timber production and are currently used for wildlife, recreation, and watershed.

The main management concerns are slope, seasonally saturated soil conditions, potential for mass wasting on unstable slopes, and low soil strength.

Udic Soils Derived from Schist on Mountains

5. Coppercreek-Ahpah-Lacks creek, moderately deep to very deep, nearly level to very steep

Moderately deep to very deep, nearly level to very steep, well drained soils that have little seasonal fluctuation in soil temperature and that formed in residuum and colluvium derived from schist; on mountain slopes and ridges

This map unit is on mountain slopes and ridges west of Redwood Creek and within the Mill Creek and Rock Creek watersheds. The vegetation is mainly redwood, Douglas-fir, western hemlock, red alder, and tanoak with an understory dominated by evergreen shrubs. Elevation ranges from 65 to 2,790 feet (20 to 850 meters). The average annual precipitation is 70 to 100 inches (1,780 to 2,540 millimeters), the average annual air temperature is 50 to 55 degrees F (10 to 13 degrees C), and the frost-free season is 220 to 290 days. A moderately strong marine influence minimizes seasonal fluctuations in air temperature and soil temperature.

This unit makes up about 17 percent of the survey area. It is about 40 percent Coppercreek and similar soils, 15 percent Ahpah and similar soils, 15 percent Lacks creek and similar soils, and 30 percent soils and miscellaneous areas of minor extent.

The Coppercreek soils are very deep and well drained. Typically, the surface layer is gravelly loam. The subsoil is gravelly clay loam. The substratum is gravelly or very gravelly clay loam. Slopes range from 15 to 75 percent.

The Ahpah soils are moderately deep and well drained. Typically, the surface layer is gravelly clay loam. The subsoil is gravelly loam or gravelly silty clay loam. The substratum is very gravelly loam. Depth to soft bedrock ranges from 50 to 100 centimeters (20 to 40 inches). Slopes range from 15 to 50 percent.

The Lacks creek soils are moderately deep and well drained. Typically, the surface layer is very gravelly loam. The texture of the subsoil ranges from very gravelly loam to extremely gravelly clay loam. The substratum is very gravelly loam. Depth to hard bedrock ranges from 50 to 100 centimeters (20 to 40 inches). Slopes range from 30 to 75 percent.

Of minor extent in this unit are Devils creek, Fortyfour, Pittplace, Rockysaddle, Rodgerpeak, Scaath, Tectah, Trailhead, and Wiregrass soils and Ustic Palehumults. Also included are areas of rock outcrop. Soils on the eastern edge of the Mill Creek and Rock Creek watersheds are slightly warmer and have less maritime influence, which results in decreased soil moisture and plant-available water.

Most areas of this map unit were formerly used for timber production and are currently used for wildlife, recreation, and watershed.

The main management concerns are slope, seasonally saturated soil conditions, potential for mass wasting on unstable slopes, and low soil strength.

6. Trailhead, very deep, nearly level to steep

Very deep, nearly level to steep, well drained soils that have little seasonal fluctuation in soil temperature and that formed in residuum and colluvium derived from schist; on broad ridges and upper mountain slopes

This map unit is on upper mountain slopes and broad ridgetops west of Redwood Creek. The vegetation is mainly redwood, Douglas-fir, western hemlock, red alder, and tanoak with an understory dominated by evergreen shrubs. Elevation ranges from 275 to 2,495 feet (85 to 760 meters). The average annual precipitation is 70 to 100 inches (1,780 to 2,540 millimeters), the average annual air temperature is 50 to 55 degrees F (10 to 13 degrees C), and the frost-free season is 240 to 290 days. A moderately strong marine influence minimizes seasonal fluctuations in air temperature and soil temperature.

This unit makes up about 6 percent of the survey area. It is about 75 percent Trailhead and similar soils and 25 percent soils of minor extent.

The Trailhead soils are red, very deep, and well drained. Typically, the surface layer is silty clay loam. The subsoil is silty clay loam or silty clay. Slopes range from 0 to 50 percent.

Of minor extent in this unit are Coppercreek, Fortyfour, Lacks creek, Rockysaddle, Scaath, Tectah, and Wiregrass soils. Also included are areas of rock outcrop.

Most areas of this map unit were formerly used for timber production and are currently used for wildlife, recreation, and watershed.

The main management concerns are seasonally saturated soil conditions and low soil strength.

7. Devils creek-Panthercreek-Coppercreek, very deep, steep and very steep (fig. 8)

Very deep, steep and very steep, moderately well drained and well drained soils that have little seasonal fluctuation in soil temperature and that formed in residuum and earth- and debris-flow colluvium derived from schist; on mountain slopes and recent debris flows

This map unit is on mountain slopes and recent debris flows west of the Redwood Creek watershed. The vegetation is mainly redwood, Douglas-fir, western hemlock, red alder, bigleaf maple, and tanoak with an understory dominated by deciduous shrubs or ferns. Elevation ranges from 65 to 2,410 feet (20 to 735 meters). The average annual precipitation is 70 to 100 inches (1,780 to 2,540 millimeters), the average annual air temperature is 50 to 55 degrees F (10 to 13 degrees C), and the frost-free season is 240 to 300 days. A moderately strong marine influence minimizes seasonal fluctuations in air temperature and soil temperature.

This unit makes up about 4 percent of the survey area. It is about 40 percent Devils creek and similar soils, 25 percent Panthercreek and similar soils, 15 percent Coppercreek and similar soils, and 20 percent soils and miscellaneous areas of minor extent.

The Devils creek soils are very deep and moderately well drained. Typically, the surface layer is gravelly loam. The subsoil is cobbly clay loam or gravelly clay loam. The substratum is very gravelly silt loam. Depth to the seasonal high water table ranges from 50 to 100 centimeters (20 to 40 inches). Slopes range from 30 to 75 percent.

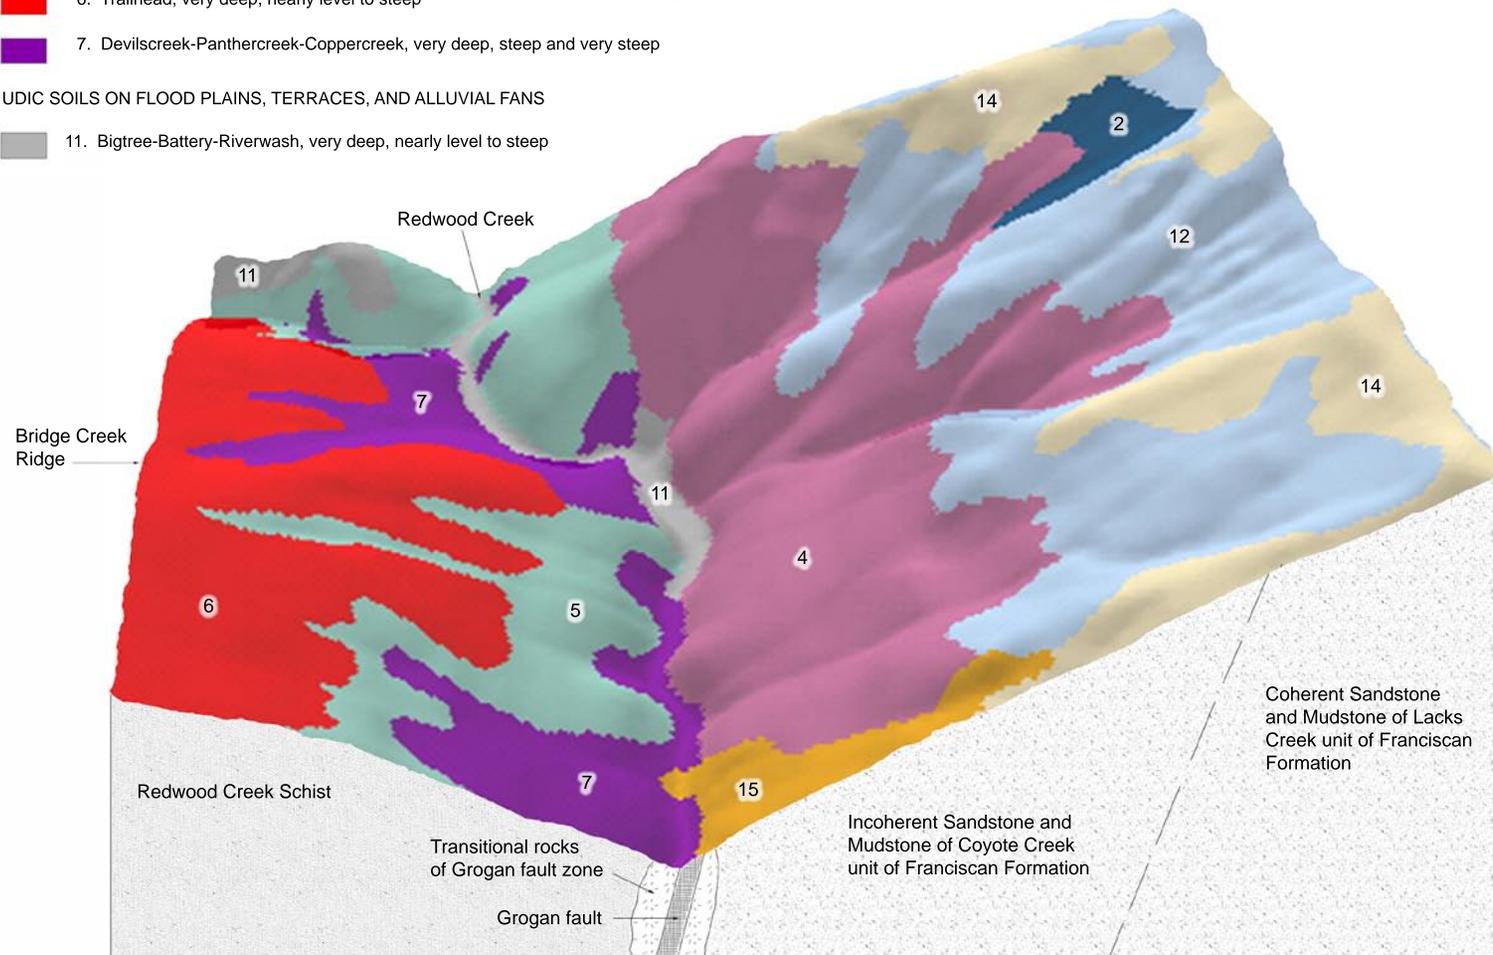

Figure 8.—Block diagram 3. Generalized pattern of soil distribution and conceptualized geology in the Redwood Creek watershed viewed from the Hog Prairie area north towards Harry Weir Creek.

The Panthercreek soils are very deep and well drained. Typically, the surface layer is gravelly loam. The subsoil is very gravelly loam or extremely gravelly loam. The substratum is very gravelly loam or very gravelly sandy loam. Slopes range from 30 to 75 percent.

The Coppercreek soils are very deep and well drained. Typically, the surface layer is gravelly loam. The subsoil is gravelly clay loam. The substratum is gravelly clay loam or very gravelly clay loam. Slopes range from 30 to 75 percent.

Of minor extent in this unit are Ahpah and Lacks creek soils. Also included are areas of rock outcrop.

Most areas of this map unit were formerly used for timber production and are currently used for wildlife, recreation, and watershed.

The main management concerns are slope, seasonally saturated soil conditions, potential for mass wasting on unstable slopes, and low soil strength.

8. Ladybird-Stonehill, moderately deep to very deep, moderately steep to very steep

Moderately deep to very deep, moderately steep to very steep, well drained soils that have little seasonal fluctuation in soil temperature, that formed in residuum and colluvium derived from schist, and that have a strong influence from coastal fog; on lower mountain slopes

This map unit is on lower mountain slopes within the lower Redwood Creek basin. The vegetation is mainly redwood, Sitka spruce, western hemlock, Douglas-fir, red alder, and tanoak with an understory dominated by deciduous shrubs or ferns. Elevation ranges from sea level to 1,250 feet (0 to 380 meters). The average annual precipitation is 70 to 85 inches (1,780 to 2,160 millimeters), the average annual air temperature is 50 to 55 degrees F (10 to 13 degrees C), and the frost-free season is 250 to 300 days. A strong marine influence minimizes seasonal fluctuations in air temperature and soil temperature.

This unit makes up about 3 percent of the survey area. It is about 55 percent Ladybird and similar soils, 15 percent Stonehill and similar soils, and 30 percent soils of minor extent.

The Ladybird soils are very deep and well drained. Typically, the surface layer is gravelly loam. The subsoil is gravelly clay loam or gravelly silt clay loam. The substratum is very gravelly loam or very gravelly clay loam. Slopes range from 15 to 50 percent.

The Stonehill soils are moderately deep and well drained. Typically, the surface layer is cobbly silt loam. The subsoil is gravelly silty clay loam. Depth to hard bedrock ranges from 50 to 100 centimeters (20 to 40 inches). Slopes range from 30 to 50 percent.

Of minor extent in this unit are Coppercreek, Devils creek, Lacks creek, Panthercreek, Sasquatch, and Trailhead soils. Also included are areas of rock outcrop.

Most areas of this map unit were formerly used for timber production and are currently used for wildlife, recreation, and watershed.

The main management concerns are slope, seasonally saturated soil conditions, potential for mass wasting on unstable slopes, and low soil strength.

Udic Soils Derived from Weakly Consolidated Sandstone and Conglomerate on Hills

9. *Ossagon-Goldbluffs-Squashan, very deep, nearly level to steep*

Very deep, nearly level to steep, well drained soils that have little seasonal fluctuation in soil temperature and that formed in colluvium and residuum from weakly consolidated sandstone and conglomerate; on hillslopes and ridges

This map unit is on mountains, hillslopes, and ridges north and northeast of Orick. The vegetation is mainly redwood, Douglas-fir, western hemlock, red alder, and tanoak with an understory dominated by evergreen shrubs. Elevation ranges from 0 to 1,020 feet (0 to 310 meters). The average annual precipitation is 60 to 80 inches (1,520 to 2,030 millimeters), the average annual air temperature is 50 to 55 degrees F (10 to 13 degrees C), and the frost-free season is 260 to 325 days. A strong marine influence minimizes seasonal fluctuations in air temperature and soil temperature.

This unit makes up about 9 percent of the survey area. It is about 40 percent Ossagon and similar soils, 35 percent Goldbluffs and similar soils, 15 percent Squashan and similar soils, and 10 percent soils of minor extent.

The Ossagon soils are very deep and well drained. Typically, the surface layer is loam. The subsoil is clay loam or silty clay loam. The substratum is loam or sandy loam. Slopes range from 9 to 50 percent.

The Goldbluffs soils are very deep and well drained. Typically, the surface layer is very gravelly loam. The subsoil is also very gravelly loam or is very gravelly sandy loam. The substratum is very gravelly coarse sandy loam or extremely gravelly sandy loam. Slopes range from 9 to 50 percent.

The Squashan soils are very deep and well drained. Typically, the surface layer is gravelly loam. The subsoil is very gravelly loam or very gravelly sandy loam. The substratum is very gravelly loamy sand or very gravelly sand. Slopes range from 9 to 50 percent.

Of minor extent in this unit are Coppercreek, Espa, Lacks creek, and Sasquatch soils.

Most areas of this map unit were formerly used for timber production and are currently used for wildlife, recreation, and watershed.

The main management concerns are seasonally saturated soil conditions, potential for mass wasting on unstable slopes, and low soil strength.

Udic Soils Derived from Weakly Consolidated Sandstone and Conglomerate on Mountains

10. *Ossagon-Squashan-Surpur, very deep, nearly level to steep*

Very deep, nearly level to steep, well drained soils that have little seasonal fluctuation in soil temperature and that formed in colluvium and residuum derived from weakly consolidated sandstone and conglomerate; dominantly on mountain slopes and ridges

This map unit is dominantly on mountain slopes and ridges east of Prairie Creek, south of Cedar Creek, and on Childs Hill. The vegetation is mainly redwood, Douglas-fir, western hemlock, red alder, and tanoak with an understory of deciduous shrubs. Elevation ranges from 180 to 2,365 feet (55 to 720 meters). The average annual precipitation is 70 to 100 inches (1,780 to 2,550 millimeters), the average annual air

temperature is 50 to 55 degrees F (10 to 13 degrees C), and the frost-free season is 240 to 300 days. A strong marine influence minimizes seasonal fluctuations in air temperature and soil temperature.

This unit makes up about 3 percent of the survey area. It is about 45 percent Ossagon and similar soils, 25 percent Squashan and similar soils, 15 percent Surpur and similar soils, and 15 percent soils of minor extent.

The Ossagon soils are very deep and well drained. Typically, the surface layer is loam. The subsoil is loam, silt loam, or clay loam. The substratum is sandy loam. Slopes range from 9 to 50 percent.

The Squashan soils are very deep and well drained. Typically, the surface layer is gravelly loam. The subsoil is very gravelly loam or very gravelly sandy clay loam. The substratum is very gravelly sandy clay loam or very gravelly loamy sand. Slopes range from 9 to 50 percent.

The Surpur soils are very deep and well drained. Typically, the surface layer is gravelly loam. The subsoil is gravelly clay loam. The substratum is fine sandy loam or loamy sand. Slopes range from 2 to 30 percent.

Of minor extent in this unit are Childshill, Coppercreek, Lacks creek, Mettah, Scaath, and Wiregrass soils. Also included are areas of rock outcrop.

Most areas of this map unit were formerly used for timber production and are currently used for wildlife, recreation, and watershed.

The main management concerns are seasonally saturated soil conditions, potential for mass wasting on unstable slopes, and low soil strength.

Udic Soils on Flood Plains, Terraces, and Alluvial Fans

11. *Bigtree-Battery-Riverwash, very deep, nearly level to steep*

Very deep, nearly level to steep, well drained to excessively drained soils that have little seasonal fluctuation in soil temperature and that formed in alluvium derived from mixed sources; on flood plains, low terraces, alluvial fans, and dissected terrace remnants

This map unit is on flood plains, low terraces, alluvial fans, and dissected terrace remnants along lower Redwood Creek, Prairie Creek, Mill Creek, the Klamath River, and the Smith River. The vegetation is mainly redwood, Sitka spruce, alder, bigleaf maple, western hemlock, Douglas-fir, and tanoak with an understory dominated by deciduous shrubs, swordfern, and Oregon sorrel. Some areas have little or no vegetation. Minor components have pasture vegetation or are reverting to pasture vegetation. Elevation ranges from sea level to 670 feet (0 to 205 meters). The average annual precipitation is 35 to 90 inches (890 to 2,300 millimeters), the average annual air temperature is 50 to 59 degrees F (10 to 15 degrees C), and the frost-free season is 240 to 330 days. A strong marine influence minimizes seasonal fluctuations in air temperature and soil temperature.

This unit makes up about 4 percent of the survey area. It is about 25 percent Bigtree and similar soils, 15 percent Battery and similar soils, 15 percent Riverwash, and 45 percent soils of minor extent.

The Bigtree soils are very deep and well drained. Typically, the surface layer is loam. The subsoil is also loam. The substratum is sandy loam or silt loam. Slopes range from 2 to 9 percent.

The Battery soils are very deep and well drained. Typically, the surface layer is gravelly loam. The substratum is gravelly clay loam. Slopes range from 5 to 50 percent.

The Riverwash is very deep and excessively drained. It consists of sand, gravel, and cobbles. Slopes range from 0 to 4 percent.

Of minor extent in this unit are Arlynda, Aubell, Bigriver, Catchings, Ferndale, Loleta, Mystery, Russ, Swainslough, Talawa, Tarquin, Tsunami, Weott, and Worswick soils.

Areas of this map unit were formerly used for pasture and timber production and are currently used for wildlife, recreation, and watershed. Also included are areas of Beaches and Dune land.

The main management concerns are seasonally saturated soil conditions, ponding, and flooding.

Ustic Soils Derived from Sandstone and Mudstone on Mountains

12. *Wiregrass-Rockysaddle-Scaath, moderately deep to very deep, strongly sloping to very steep* (fig. 9)

Moderately deep to very deep, strongly sloping to very steep, well drained soils that have moderate seasonal fluctuations in soil temperature and that formed in residuum and colluvium derived from sandstone and mudstone; on mountain slopes and ridges

This map unit is on mountain slopes and ridges east of Redwood Creek and on the eastern edge of the Mill Creek and Rock Creek watersheds. The vegetation is mainly Douglas-fir, tanoak, madrone, California bay, and scattered pockets of redwood with a sparse understory dominated by evergreen shrubs. Elevation ranges from 340 to 3,200 feet (105 to 975 meters). The average annual precipitation is 75 to 100 inches (1,780 to 2,540 millimeters), the average annual air temperature is 50 to 55 degrees F (10 to 13 degrees C), and the frost-free season is 220 to 290 days. A moderately weak marine influence minimizes seasonal fluctuations in air temperature and soil temperature.

This unit makes up about 8 percent of the survey area. It is about 50 percent Wiregrass and similar soils, 25 percent Rockysaddle and similar soils, 15 percent Scaath and similar soils, and 10 percent soils and miscellaneous areas of minor extent.

The Wiregrass soils are very deep and well drained. Typically, the surface layer is very gravelly loam. The subsoil is gravelly clay loam or gravelly silty clay loam. The substratum is very gravelly clay loam. Slopes range from 9 to 75 percent.

The Rockysaddle soils are very deep and well drained. Typically, the surface layer is extremely gravelly loam. The subsoil is very gravelly clay loam. The substratum is extremely gravelly clay loam. Slopes range from 30 to 75 percent.

The Scaath soils are moderately deep and well drained. Typically, the surface layer is gravelly loam. The subsoil is very cobbly clay loam or very gravelly clay loam. The substratum is very gravelly clay loam or extremely gravelly clay loam. Depth to hard bedrock ranges from 50 to 100 centimeters (20 to 40 inches). Slopes range from 9 to 75 percent.

Of minor extent in this unit are Ahpah, Airstrip, Atwell, Countshill, Dolason, and Pittplace soils. Also included are areas of rock outcrop.

Most areas of this map unit were formerly used for timber production and are currently used for wildlife, recreation, and watershed.

The main management concerns are slope, seasonally saturated soil conditions, potential for mass wasting on unstable slopes, and low soil strength.

General Soil Map Units

UDIC SOILS DERIVED FROM SANDSTONE AND MUDSTONE ON MOUNTAINS

4. Atwell-Coppercreek, very deep, moderately steep and steep

UDIC SOILS DERIVED FROM SCHIST ON MOUNTAINS

5. Coppercreek-Ahpah-Lacks creek, moderately deep to very deep, nearly level to very steep

7. Devils creek-Panther creek-Coppercreek, very deep, steep and very steep

USTIC SOILS DERIVED FROM SANDSTONE AND MUDSTONE ON MOUNTAINS

12. Wiregrass-Rockysaddle-Scaath, moderately deep to very deep, strongly sloping to very steep

XERIC SOILS DERIVED FROM SANDSTONE AND MUDSTONE ON MOUNTAINS

13. Sidehill-Mooncreek-Oakside, shallow to very deep, strongly sloping to very steep

14. Dolason-Elkcamp-Airstrip, moderately deep to very deep, nearly level to steep

15. Pasturerock-Coyoterock-Doolyville, very deep, moderately steep and steep

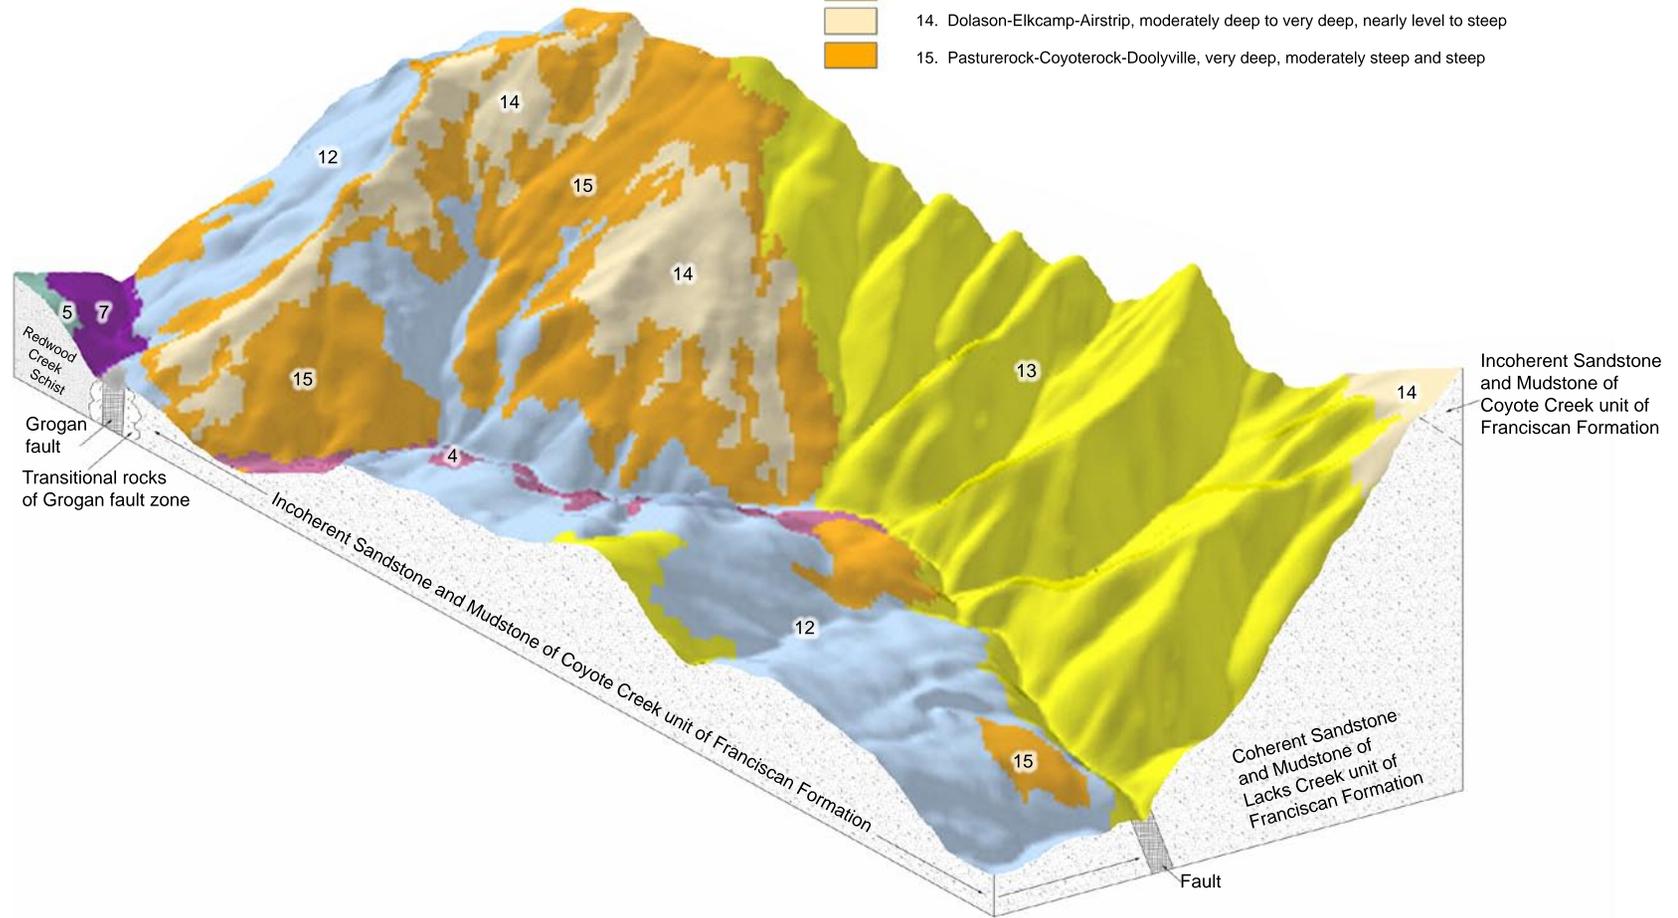

Figure 9.—Block diagram 4. Generalized pattern of soil distribution and conceptualized geology in the Lacks Creek watershed viewed from the Faulkner Prairie area northeast towards Arbor Camp Ridge.

Xeric Soils Derived from Sandstone and Mudstone on Mountains

13. Sidehill-Mooncreek-Oakside, shallow to very deep, strongly sloping to very steep (fig. 10)

Shallow to very deep, strongly sloping to very steep, somewhat excessively drained and well drained soils that have moderate seasonal fluctuation in soil temperature and that formed in residuum and colluvium derived from sandstone and mudstone; on mountain slopes and ridges

This map unit is on mountain slopes and ridges within the lower Redwood Creek and Lacks Creek watersheds. The vegetation is mainly Douglas-fir, tanoak, madrone, and California bay with a sparse understory dominated by evergreen shrubs. Elevation ranges from 950 to 4,085 feet (290 to 1,245 meters). The average annual precipitation is 80 to 100 inches (2,050 to 2,540 millimeters), the average annual air temperature is 48 to 55 degrees F (9 to 13 degrees C), and the frost-free season is 150 to 250 days. A moderately weak marine influence enables moderate seasonal fluctuations in air temperature and soil temperature.

This unit makes up about 4 percent of the survey area. It is about 35 percent Sidehill and similar soils, 20 percent Mooncreek and similar soils, 20 percent Oakside and similar soils, and 25 percent soils and miscellaneous areas of minor extent.

The Sidehill soils are moderately deep and well drained. Typically, the surface layer is gravelly loam. The subsoil is very gravelly loam. The substratum is extremely cobbly loam. Depth to hard bedrock ranges from 50 to 100 centimeters (20 to 40 inches). Slopes range from 30 to 100 percent.

The Mooncreek soils are very deep and well drained. Typically, the surface layer is very gravelly loam. The subsoil is gravelly clay loam. The substratum is gravelly clay loam or very gravelly clay loam. Slopes range from 9 to 75 percent.

Figure 10.—View of Rodger's Peak in the background. Pictured are areas of Wiregrass-Scaath complex, 30 to 50 percent slopes, on dry, upper mountain slopes covered by Douglas-fir and redwood. Also pictured are areas of Coppercreek-Ahpah-Lacks creek complex, 30 to 50 percent slopes, on moist, lower mountain slopes and areas of Trailhead-Fortyfour complex, 30 to 50 percent slopes, on narrow spur ridges.

The Oaksides soils are shallow and somewhat excessively drained. Typically, the surface layer is extremely gravelly loam. The subsoil is extremely cobbly loam. Depth to hard bedrock ranges from 25 to 50 centimeters (10 to 20 inches). Slopes range from 50 to 100 percent.

Of minor extent in this unit are Darkwoods, Flyatt, Hawthorse, Highoaks, Mudhorse, Noisy, Rockus, and Tossup soils. Also included are areas of rock outcrop.

Most areas of this map unit are used for timber production, wildlife, recreation, and watershed.

The main management concerns are slope, seasonally saturated soil conditions, potential for mass wasting on unstable slopes, and low soil strength.

14. Dolason-Elkcamp-Airstrip, moderately deep to very deep, nearly level to steep

Moderately deep to very deep, nearly level to steep, well drained soils that formed in residuum and colluvium derived from sandstone, mudstone and siltstone; mainly on upper mountain slopes and ridges with a minor extent on lower mountain slopes

This map unit is along the lower Redwood Creek basin on uniform to undulating mountain slopes shaped by earthflows and on ridges. The vegetation is mainly annual grasses and forbs. Invasion by Douglas-fir and other forest species occurs primarily in disturbed areas, along forest borders, and in zones where prescribed burning or cutting has stopped. Elevation ranges from 540 to 3,865 feet (165 to 1,178 meters). The average annual precipitation is 70 to 100 inches (1,780 to 2,540 millimeters), the average annual air temperature is 50 to 59 degrees F (10 to 15 degrees C), and the frost-free season is 200 to 280 days.

This unit makes up about 3 percent of the survey area. It is about 40 percent Dolason and similar soils, 25 percent Elkcamp and similar soils, 15 percent Airstrip and similar soils, and 20 percent soils and miscellaneous areas of minor extent.

The Dolason soils are very deep and well drained. Typically, the surface layer is thick, dark, and consists of gravelly loam. The subsoil is gravelly loam or very gravelly loam. The substratum is very gravelly loam. Slopes range from 9 to 50 percent.

The Elkcamp soils are very deep and well drained. Typically, the surface layer is thick, dark, and consists of gravelly loam. The subsoil is gravelly clay loam. The substratum is very gravelly clay loam. Slopes range from 15 to 50 percent.

The Airstrip soils are moderately deep and well drained. Typically, the surface layer is thick, dark, and consists of gravelly loam. The subsoil is very gravelly loam. Depth to hard bedrock ranges from 50 to 100 centimeters (20 to 40 inches). Slopes range from 9 to 50 percent.

Of minor extent in this unit are Countshill, Pigpen, and Raingage soils. Also included are areas of rock outcrop.

Most areas of this map unit were formerly used for livestock grazing and are currently used for wildlife, recreation, and watershed. They are capable of supporting forest vegetation.

The main management concerns are slope, seasonally saturated soil conditions, potential for mass wasting on unstable slopes, and low soil strength.

15. Pasturerock-Coyoterock-Doolyville, very deep, moderately steep and steep

Very deep, moderately steep and steep, somewhat poorly drained to well drained soils that formed in residuum and colluvium derived from mudstone and sandstone; on mountain slopes and ridges

This map unit is on steep, uniform to undulating mountain slopes shaped by earthflows, poorly incised drainages, and ridges in the lower Redwood Creek basin.

The vegetation is mainly oak woodland with California bay and an understory of grasses and forbs. Some areas have been invaded by Douglas-fir and are in succession to coniferous forest. Elevation ranges from 165 to 3,265 feet (50 to 995 meters). The average annual precipitation is 70 to 100 inches (1,780 to 2,540 millimeters), the average annual air temperature is 50 to 59 degrees F (10 to 15 degrees C), and the frost-free season is 200 to 270 days.

This unit makes up about 2 percent of the survey area. It is about 35 percent Pasturerock and similar soils, 20 percent Coyoterock and similar soils, 15 percent Doolyville and similar soils, and 30 percent soils and miscellaneous areas of minor extent.

The Pasturerock soils are very deep and well drained. Typically, the surface layer is dark loam. The subsoil is clay loam or gravelly clay loam. The substratum is very gravelly sandy clay loam. Slopes range from 30 to 50 percent.

The Coyoterock soils are very deep and moderately well drained. Typically, the surface layer is dark cobbly clay loam. The subsoil is gravelly clay loam or gravelly clay. The substratum is gravelly silty clay. Depth to the seasonal high water table ranges from 50 to 100 centimeters (20 to 40 inches). Slopes range from 30 to 50 percent.

The Doolyville soils are very deep and somewhat poorly drained. Typically, the surface layer is dark silt loam. The subsoil is silty clay loam or gravelly silty clay loam. The substratum is very gravelly silty clay loam. Depth to the seasonal high water table ranges from 25 to 50 centimeters (10 to 20 inches). Slopes range from 30 to 50 percent.

Of minor extent in this unit are Airstrip and Maneze soils. Also included are areas of rock outcrop.

Most areas of this map unit were formerly used for livestock grazing and are currently used for wildlife, recreation, and watershed. They are capable of supporting forest vegetation.

The main management concerns are slope, seasonally saturated soil conditions, potential for mass wasting on unstable slopes, and low soil strength.

Xeric Soils Derived from Serpentinite and Peridotite on Mountains

16. Jayel-Oragan-Walnett, shallow to very deep, nearly level to very steep

Shallow to very deep, nearly level to very steep, well drained soils that have moderately little seasonal fluctuation in soil temperature and that formed in residuum and colluvium derived from serpentinite, peridotite, and serpentinitized peridotite of the Klamath Terrace; on upper mountain slopes and ridges

This map unit is on upper mountain slopes and ridges along the eastern margins of the Mill Creek and Rock Creek watersheds. The vegetation is mainly Jeffery pine, knobcone pine, Douglas-fir, and tanoak with an understory dominated by evergreen shrubs. Some areas are dominated by grass communities. Elevation ranges from 165 to 3,020 feet (50 to 920 meters). The average annual precipitation is 90 to 120 inches (2,300 to 3,050 millimeters), the average annual air temperature is 50 to 55 degrees F (10 to 13 degrees C), and the frost-free season is 100 to 180 days. A moderately strong marine influence minimizes seasonal fluctuations in air temperature and soil temperature.

This unit makes up about 2 percent of the survey area. It is about 30 percent Jayel and similar soils, 20 percent Oragan and similar soils, 20 percent Walnett and similar soils, and 30 percent soils and miscellaneous areas of minor extent.

The Jayel soils are moderately deep and well drained. Typically, the surface layer is stony clay loam. The subsoil is stony clay. Depth to hard bedrock ranges from 50 to 100 centimeters (20 to 40 inches). Slopes range from 9 to 75 percent.

The Oragan soils are shallow and well drained. Typically, the surface layer is very stony loam. The subsoil is stony silty loam. Depth to hard bedrock ranges from 25 to 50 centimeters (10 to 20 inches). Slopes range from 9 to 75 percent.

The Walnett soils are very deep and well drained. Typically, the surface layer is very stony loam. The subsoil is very gravelly clay loam, extremely gravelly loam, or gravelly clay loam. Slopes range from 9 to 75 percent.

Of minor extent in this unit are Rockysaddle, Scaath, Trailhead, and Wiregrass soils. Also included are areas of rock outcrop.

Most areas of this map unit were formerly used for selective timber production and are currently used for wildlife, recreation, and watershed.

The main management concerns are slope, seasonally saturated soil conditions, potential for mass wasting on unstable slopes, and low soil strength.

General Ecological Site Map Units

The general ecological site maps in this publication show broad areas that have a distinctive pattern of vegetation and soils. The map units on the general ecological site maps are unique natural communities. Typically, they consist of one to three dominant ecological site units that are generalized in geographic distribution. They are named for the dominate ecological site or combination of ecological sites. Refer to “Forestland Ecological Sites” and “Rangeland Ecological Sites” in the “Use and Management of the Soils” section for more detailed ecological site descriptions.

Generalized Ecological Site Descriptions

A. Redwood–Douglas-fir/Pacific rhododendron, mountain slopes, schist, clay loam.—This unit consists dominantly of forestland ecological sites F004BX101CA and F004BX115CA, which are on mountain slopes west of Redwood Creek.

B. Douglas-fir–redwood/tanoak, mountain slopes, sandstone, clay loam.—This unit consists dominantly of forestland ecological site F004BX102CA, which is on inland mountain slopes, dominantly in the lower Redwood Creek basin.

C. Redwood–Douglas-fir/Pacific rhododendron, mountain slopes, sandstone, clay loam.—This unit consists dominantly of forestland ecological site F004BX103CA, which is in the Mill Creek and Rock Creek watersheds, east of Redwood Creek near and southeast of Orick Valley.

D. Redwood–Douglas-fir/Pacific rhododendron, ridgetops, schist, red clay.—This unit consists dominantly of forestland ecological site F004BX104CA, which is on ridgetops and upper mountain slopes west of Redwood Creek and east of Prairie Creek.

E. Douglas-fir–tanoak/California huckleberry, ridgetops, schist, red clay.—This unit consists dominantly of forestland ecological site F004BX105CA, which is on dry upper mountain slopes and narrow ridgetops, dominantly west of Redwood Creek.

F. Redwood/western swordfern, hills, soft sandstone, clay loam.—This unit consists dominantly of forestland ecological sites F004BX106CA and F004BX107CA, which are on hills north and northeast of Orick, in the Prairie Creek watershed.

G. Redwood/western swordfern, mountain slopes, sandstone and schist, clay loam.—This unit consists dominantly of forestland ecological site F004BX108CA, which is on mountain slopes in close proximity to the coast throughout the survey area.

H. Douglas-fir–redwood/tanoak–California huckleberry, mountain slopes, sandstone and schist, clay loam.—This unit consists dominantly of forestland ecological site F004BX109CA, which is on dry, upper mountain slopes and broad ridges in the Mill Creek and Rock Creek watersheds.

I. Sitka spruce–red alder/salmonberry/western swordfern, hills, sandstone and mudstone, clay loam.—This unit consists dominantly of forestland ecological site F004BX110CA, which is on hills along the immediate coast throughout the survey area.

J. Redwood/western swordfern–redwood-sorrel, flood plains and terraces, loam.—This unit consists dominantly of forestland ecological site F004BX111CA, which is on low terraces, alluvial fans, fan remnants, and moist valley floors near creeks and rivers throughout the survey area.

K. Oregon white oak/orchardgrass, lower mountain slopes, sandstone and mudstone, silty clay loam.—This unit consists dominantly of forestland ecological site F004BX112CA, which is on lower mountain slopes east of Redwood Creek.

L. Douglas-fir–giant chinquapin/California huckleberry, ridgetops, soft sandstone, clay loam.—This unit consists dominantly of forestland ecological site F004BX113CA, which is on broad ridges and upper mountain slopes on and near Childs Hill in the Mill Creek watershed.

M. Oregon white oak/bristly dogtail grass, mountain slopes, sandstone and mudstone, clay loam.—This unit consists dominantly of forestland ecological site F004BX114CA, which is on mountain slopes east of Redwood Creek.

N. Upper prairie, mountain slopes, sandstone and mudstone, clay loam.—This unit consists dominantly of rangeland ecological site R004BX101CA, which is on upper mountain slopes and broad ridges east of Redwood Creek in the Bald Hills.

O. Coastal scrub and prairie, hills, sandstone and mudstone, gravelly clay loam.—This unit consists dominantly of rangeland ecological site R004BX102CA, which is on hills along the immediate coast throughout the survey area.

P. Lower prairie, earthflows, sandstone and mudstone, gravelly loam.—This unit consists dominantly of rangeland ecological site R004BX103CA, which is in slump positions on lower mountain slopes east of Redwood Creek.

Q. Middle prairie, mountain slopes, sandstone and mudstone, gravelly clay loam.—This unit consists dominantly of rangeland ecological site R004BX104CA, which is on mountain slopes east of Redwood Creek.

R. Douglas-fir–tanoak/tanoak, mountain slopes, sandstone and mudstone, clay loam.—This unit consists dominantly of forestland ecological sites F005BX101CA, F005BX102CA, and F005BX103CA, which are on mountain slopes near Beaver and Pine Ridge.

S. Jeffrey pine/huckleberry oak, mountain slopes, serpentinite and peridotite, clay loam.—This unit consists dominantly of forestland ecological sites F005BX104CA and F005XB105CA, which are on mountain slopes along the eastern margins of Mill Creek and Rock Creek.

Detailed Soil Map Units

The map units delineated on the detailed soil maps in this survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions in this section, along with the maps, can be used to determine the suitability and potential of a unit for specific uses. They also can be used to plan the management needed for those uses. More information about each map unit is given under the heading "Use and Management of Soils."

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. The contrasting components are mentioned in the map unit descriptions. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives the principal hazards and limitations to be considered in planning for specific uses.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Ferndale, moderately well drained, 0 to 5 percent slopes, is a phase of the Ferndale series.

Some map units are made up of one major soil or miscellaneous area. These map units are consociations. Consociations are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soil or miscellaneous areas in association with other soils or miscellaneous areas. The relative proportion of the soil or miscellaneous area is greater than 75 percent. Trailhead, 0 to 9 percent slopes, is an example.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Trailhead-Fortyfour complex, 30 to 50 percent slopes, is an example.

This survey includes *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. The Beaches component of Beaches-Samoa-Dune land complex, 0 to 50 percent slopes, is an example.

Table 3 gives the acreage and proportionate extent of each map unit. Other tables give properties of the soils and the limitations, capabilities, and potentials for many uses. The Glossary defines many of the terms used in describing the soils or miscellaneous areas.

100—Riverwash

Map Unit Setting

General location: Active channels of major rivers and creeks

Major land resource area: 4B—Coastal Redwood Belt

Landscape: Mountains

Landform: Annual flood plains

Elevation: 25 to 350 feet (9 to 108 meters)

Mean annual precipitation: 60 to 90 inches (1,520 to 2,290 millimeters)

Mean annual air temperature: 50 to 59 degrees F (10 to 15 degrees C)

Frost-free period: 250 to 300 days

Map Unit Composition

Riverwash—90 percent

Minor components—10 percent

Characteristics of Riverwash

Slope: 0 to 4 percent

Aspect: Northwest clockwise to west

Landform: Active channels

Parent material: Stratified alluvium derived from mixed sources

Typical vegetation: Few annual herbs and re-sprouting willows

Surface area covered by coarse fragments: 10 to 20 percent subrounded cobbles and 35 to 60 percent coarse, subrounded pebbles

Restrictive feature: None noted

Slowest permeability class: Rapid

Available water capacity to a depth of 60 inches: About 0.8 inch (very low)

Hydrologic properties

Present annual flooding: Frequent
Present annual ponding: None
Surface water runoff class: Very high
Current water table: Present
Natural drainage class: Excessively drained
Hydrologic soil group: A/D

Interpretive groups

Land capability classification, nonirrigated: 8
Ecological site: None assigned

Minor Components

Fluents and similar soils

Composition: About 10 percent
Slope: 0 to 4 percent
Landform: Flats adjacent to the stream channels
Ecological site: None assigned

102—Fluents, 2 to 5 percent slopes

Map Unit Setting

General location: Low terraces and flood plains adjacent to active channels of major rivers and creeks
Major land resource area: 4B—Coastal Redwood Belt
Landscape: Mountains
Landform: Flood plains and low terraces
Elevation: 0 to 570 feet (0 to 175 meters)
Mean annual precipitation: 60 to 75 inches (1,520 to 1,900 millimeters)
Mean annual air temperature: 50 to 55 degrees F (10 to 13 degrees C)
Frost-free period: 300 to 330 days

Map Unit Composition

Fluents—75 percent
Minor components—25 percent

Characteristics of Fluents and Similar Soils

Slope: 2 to 5 percent
Aspect: Southeast clockwise to west
Landform: Terraces and flood plains near the margin of the active channel
Parent material: Overbank alluvium derived from mixed sources
Typical vegetation: Riparian woodland dominated by willows (*Salix* spp.). Major floods remove above-ground vegetation and start new cycles of plant succession.
Surface area covered by coarse fragments: 0 to 10 percent coarse, rounded pebbles
Restrictive feature: None noted
Slowest permeability class: Moderately rapid
Available water capacity to a depth of 60 inches: About 4.3 inches (low)

Hydrologic properties

Present annual flooding: Frequent
Present annual ponding: None
Surface water runoff class: Very high
Current water table: Present
Natural drainage class: Somewhat excessively drained
Hydrologic soil group: A/D

Interpretive groups

Land capability classification, nonirrigated: 4w-2

Ecological site: None assigned

Typical profile

A—0 to 2 inches (0 to 5 centimeters); fine sandy loam

C—2 to 9 inches (5 to 24 centimeters); loam

2C1—9 to 37 inches (24 to 94 centimeters); loamy sand

2C2—37 to 60 inches (94 to 152 centimeters); very gravelly loamy coarse sand

Minor Components

Bigriver and similar soils

Composition: About 10 percent

Slope: 2 to 5 percent

Landform: Farther than the Fluvents from the active channel

Ecological site: F004BX111CA, *Sequoia sempervirens/Polystichum munitum—Oxalis oregana*

Arlynda and similar soils

Composition: About 5 percent

Slope: 2 to 5 percent

Landform: Small, wet depressions on flood plains

Ecological site: F004BX111CA, *Sequoia sempervirens/Polystichum munitum—Oxalis oregana*

Riverwash

Composition: About 5 percent

Slope: 0 to 5 percent

Landform: Flats adjacent to the stream channel

Ecological site: None assigned

Russ and similar soils

Composition: About 5 percent

Slope: 2 to 5 percent

Landform: Farther than the Fluvents from the active channel

Ecological site: None assigned

110—Weott, 0 to 2 percent slopes

Map Unit Setting

General location: Alluvial plains of rivers and major creeks in coastal areas of northern California

Major land resource area: 4B—Coastal Redwood Belt

Landscape: Alluvial plains

Landform: Alluvial plains

Elevation: 0 to 65 feet (0 to 20 meters)

Mean annual precipitation: 35 to 80 inches (890 to 2,030 millimeters)

Mean annual air temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free period: 275 to 330 days

Map Unit Composition

Weott—85 percent

Minor components—15 percent

Characteristics of Weott and Similar Soils

Slope: 0 to 2 percent

Aspect: West clockwise to south

Soil Survey of Redwood National and State Parks

Landform: Lower backswamps; depressions; low flood-plain steps

Parent material: Alluvium derived from mixed sources

Typical vegetation: Cultivated pasture grasses and forbs

Surface area covered by coarse fragments: None

Restrictive feature: None noted

Slowest permeability class: Moderately slow

Available water capacity to a depth of 60 inches: About 10.0 inches (very high)

Hydrologic properties

Present annual flooding: Occasional

Present annual ponding: Frequent

Surface water runoff class: Very high

Current water table: Present

Natural drainage class: Very poorly drained

Hydrologic soil group: B/D

Interpretive groups

Land capability classification, nonirrigated: 5w

Ecological site: None assigned

Typical profile

Ap—0 to 12 inches (0 to 31 centimeters); silt loam

Bg1—12 to 26 inches (31 to 66 centimeters); silt loam

Bg2—26 to 60 inches (66 to 152 centimeters); silt loam

Minor Components

Worswick and similar soils

Composition: About 5 percent

Slope: 0 to 2 percent

Landform: Low flood-plain steps; backswamps adjacent to natural levees

Ecological site: None assigned

Swainslough and similar soils

Composition: About 4 percent

Slope: 0 to 2 percent

Landform: Backswamps; depressions; low flood-plain steps

Ecological site: None assigned

Arlynda and similar soils

Composition: About 3 percent

Slope: 0 to 2 percent

Landform: Backswamps; depressions; low flood-plain steps; meander scars

Ecological site: None assigned

Ferndale and similar soils

Composition: About 3 percent

Slope: 0 to 2 percent

Landform: High flood-plain steps

Ecological site: None assigned

116—Swainslough, 0 to 2 percent slopes

Map Unit Setting

General location: Alluvial plains of rivers and major creeks in coastal areas of northern California

Major land resource area: 4B—Coastal Redwood Belt

Soil Survey of Redwood National and State Parks

Landscape: Alluvial plains

Landform: Alluvial plains

Elevation: 0 to 160 feet (0 to 50 meters)

Mean annual precipitation: 35 to 80 inches (890 to 2,030 millimeters)

Mean annual air temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free period: 275 to 330 days

Map Unit Composition

Swainslough—90 percent

Minor components—10 percent

Characteristics of Swainslough and Similar Soils

Slope: 0 to 2 percent

Aspect: West clockwise to south

Landform: Backswamps; depressions; low flood-plain steps; reclaimed salt marshes

Parent material: Alluvium derived from mixed sources

Typical vegetation: Cultivated pasture grasses and forbs

Surface area covered by coarse fragments: None

Restrictive feature: None noted

Slowest permeability class: Slow

Available water capacity to a depth of 60 inches: About 10.9 inches (very high)

Hydrologic properties

Present annual flooding: Occasional

Present annual ponding: Frequent

Surface water runoff class: Very high

Current water table: Present

Natural drainage class: Very poorly drained

Hydrologic soil group: C/D

Interpretive groups

Land capability classification, nonirrigated: 5w

Ecological site: None assigned

Typical profile

Oi—0 to 3 inches (0 to 8 centimeters); peat

A—3 to 12 inches (8 to 30 centimeters); silty clay loam

Bg1—12 to 20 inches (30 to 51 centimeters); silty clay loam

Bg2—20 to 29 inches (51 to 74 centimeters); silty clay loam

Bg3—29 to 38 inches (74 to 97 centimeters); silty clay loam

Bg4—38 to 65 inches (97 to 165 centimeters); silty clay loam

Minor Components

Arlynda and similar soils

Composition: About 3 percent

Slope: 0 to 2 percent

Landform: Backswamps; depressions; low flood-plain steps; meander scars

Ecological site: None assigned

Occidental and similar soils

Composition: About 2 percent

Slope: 0 to 2 percent

Landform: Reclaimed tidal marshes

Ecological site: None assigned

Weott and similar soils

Composition: About 2 percent

Slope: 0 to 2 percent

Landform: Backswamps adjacent to natural levees; low flood-plain steps

Ecological site: None assigned

Wigi and similar soils

Composition: About 2 percent

Slope: 0 to 2 percent

Landform: Salt marshes; tidal marshes

Ecological site: None assigned

Loleta and similar soils

Composition: About 1 percent

Slope: 0 to 2 percent

Landform: Alluvial fans; fan remnants

Ecological site: None assigned

119—Arlynda, 0 to 2 percent slopes

Map Unit Setting

General location: Alluvial plains of rivers and major creeks in coastal areas of northern California

Major land resource area: 4B—Coastal Redwood Belt

Landscape: Alluvial plains

Landform: Low alluvial plains

Elevation: 0 to 160 feet (0 to 50 meters)

Mean annual precipitation: 35 to 80 inches (890 to 2,030 millimeters)

Mean annual air temperature: 50 to 55 degrees F (10 to 13 degrees C)

155—Samoa-Clambeach-Dune land complex, 0 to 50 percent slopes

Map Unit Setting

General location: Northern Coast of California
Major land resource area: 4B—Coastal Redwood Belt
Landscape: Coastal plains
Landform: Dune fields
Elevation: 0 to 65 feet (0 to 20 meters)
Mean annual precipitation: 35 to 80 inches (890 to 2,030 millimeters)
Mean annual air temperature: 50 to 59 degrees F (10 to 15 degrees C)
Frost-free period: 275 to 330 days

Map Unit Composition

Samoa—50 percent
Clambeach—30 percent
Dune land—15 percent
Minor components—5 percent

Characteristics of Samoa and Similar Soils

Slope: 2 to 50 percent
Aspect: North clockwise to southeast
Landform: Recently stabilized dunes
Parent material: Eolian and marine sand derived from mixed sources
Typical vegetation: The native vegetation is a shifting dune mat community of American beachgrass (*Ammophila breviligulata*), yarrow (*Achillea millefolium*), beach strawberry (*Fragaria chiloensis*), beach wormwood (*Artemisia pycnocephala*), beach tidytips (*Layia carnosa*), coastal sand verbena (*Abronia latifolia*), goldenrod (*Solidago californica*), California polypody (*Polypodium californicum*), Brewer's rush (*Juncus breweri*), coyotebrush (*Baccharis pilularis*), and scattered shore pine. Non-native areas are composed of European beachgrass (*Ammophila arenaia*) planted to prevent sand movement and yellow bush lupine (*Lupinus arboreus*), iceplant (*Mesembryanthemum edule*), pampas grass (*Cortaderia Stapf*), and other herbaceous cover.
Surface area covered by coarse fragments: 0 to 5 percent medium, rounded pebbles
Restrictive feature: None noted
Slowest permeability class: Rapid
Available water capacity to a depth of 60 inches: About 3.7 inches (low)

Hydrologic properties

Present annual flooding: None
Present annual ponding: None
Surface water runoff class: Medium
Current water table: None noted
Natural drainage class: Somewhat excessively drained
Hydrologic soil group: A

Interpretive groups

Land capability classification, nonirrigated: 6e
Ecological site: None assigned

Typical profile

- Oi—0 to 1 inch (0 to 2 centimeters); slightly decomposed plant material
- A—1 to 6 inches (2 to 14 centimeters); sand
- AC—6 to 18 inches (14 to 45 centimeters); sand
- C—18 to 63 inches (45 to 160 centimeters); sand

Characteristics of Clambeach and Similar Soils

Slope: 0 to 2 percent

Aspect: West clockwise to south

Landform: Deflation basins; depressions

Parent material: Eolian and marine sand derived from mixed sources

Typical vegetation: Slough sedge (*Carex obnupta*), Brewer's rush (*Juncus breweri*), Spanish lotus (*Lotus purshianus*), Pacific silverweed (*Argentina egedii*), hooded lady's tresses (*Spiranthes romanzoffiana*), common spikerush (*Eleocharis macrostachya*), California wax myrtle (*Morella californica*), hooker willow (*Salix* spp.), and other native and non-native herbaceous cover.

Surface area covered by coarse fragments: 0 to 5 percent medium, rounded pebbles

Restrictive feature: None noted

Slowest permeability class: Rapid

Available water capacity to a depth of 60 inches: About 3.5 inches (low)

Hydrologic properties

Present annual flooding: None

Present annual ponding: Frequent

Surface water runoff class: Very high

Current water table: Present

Natural drainage class: Very poorly drained

Hydrologic soil group: A/D

Interpretive groups

Land capability classification, nonirrigated: 5w

Ecological site: None assigned

Typical profile

- A—0 to 9 inches (0 to 22 centimeters); sand
- Cg1—9 to 20 inches (22 to 50 centimeters); sand
- Cg2—20 to 63 inches (50 to 160 centimeters); sand

Characteristics of Dune Land

Slope: 2 to 50 percent

Aspect: North clockwise to southeast

Landform: Unvegetated dunes; foredunes

Parent material: Eolian and marine sand derived from mixed sources

Typical vegetation: Unvegetated sand

Surface area covered by coarse fragments: 0 to 5 percent medium, rounded pebbles

Restrictive feature: None noted

Slowest permeability class: Rapid

Available water capacity to a depth of 60 inches: About 3.5 inches (low)

171—Worswick-Arlynda complex, 0 to 2 percent slopes

Map Unit Setting

General location: Throughout Redwood National and State Parks

Major land resource area: 4B—Coastal Redwood Belt

Landscape: Mountains

Landform: Swampy, low-gradient portion of stream valleys

Elevation: 0 to 810 feet (0 to 247 meters)

Mean annual precipitation: 60 to 75 inches (1,520 to 1,900 millimeters)

Mean annual air temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free period: 275 to 330 days

Map Unit Composition

Worswick—40 percent

Arlynda—35 percent

Minor components—25 percent

Characteristics of Worswick and Similar Soils

Slope: 0 to 2 percent

Aspect: North clockwise to west

Landform: Backswamps and low flood-plain steps along valley floors

Parent material: Alluvium derived from mixed sources

Typical vegetation: The overstory is dominated by redwood (*Sequoia sempervirens*).

Small groups or individuals of Sitka spruce (*Picea sitchensis*), western hemlock (*Tsuga heterophylla*), or Douglas-fir (*Pseudotsuga menziesii*) grow in scattered areas throughout the unit. Some grand fir (*Abies grandis*) also grows. The understory is dominated by western swordfern (*Polystichum munitum*) and includes salal (*Gaultheria shallon*), deer fern (*Blechnum spicant*), and redwood-sorrel (*Oxalis oregana*). Moist areas may include rushes (*Juncus* spp.), sedges (*Carex* spp.), and American skunkcabbage (*Lysichiton americanus*).

Surface area covered by coarse fragments: None

Restrictive feature: None noted

Slowest permeability class: Moderately slow

Available water capacity to a depth of 60 inches: About 9.6 inches (high)

Hydrologic properties

Present annual flooding: Occasional

Present annual ponding: Occasional

Surface water runoff class: Very high

Current water table: Present

Natural drainage class: Very poorly drained

Hydrologic soil group: B/D

Interpretive groups

Land capability classification, nonirrigated: 3w-2

Ecological site: F004BX111CA, *Sequoia sempervirens/Polystichum munitum–Oxalis oregana*

Typical profile

Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material

A—1 to 17 inches (3 to 43 centimeters); silt loam

Bg1—17 to 27 inches (43 to 68 centimeters); loam

Bg2—27 to 58 inches (68 to 148 centimeters); loam

Bg3—58 to 62 inches (148 to 158 centimeters); gravelly loamy sand

Characteristics of Arlynda and Similar Soils

Slope: 0 to 2 percent

Aspect: North clockwise to west

Landform: Depressions and low flood-plain steps on valley floors

Parent material: Alluvium derived from mixed sources

Typical vegetation: The overstory is dominated by redwood (*Sequoia sempervirens*).

Small groups or individuals of Sitka spruce (*Picea sitchensis*), western hemlock (*Tsuga heterophylla*), or Douglas-fir (*Pseudotsuga menziesii*) grow in scattered areas throughout the unit. Some grand fir (*Abies grandis*) also grows. Ecological site: F004BX103CA, *Sequoia sempervirens–Pseudotsuga menziesii/Rhododendron macrophyllum*

Riverwash

Composition: About 10 percent

Slope: 2 to 5 percent

Landform: Active channels

Ecological site: None assigned

173—Bigriver-Ferndale-Russ complex, 2 to 5 percent slopes

Map Unit Setting

General location: Along Redwood Creek

Major land resource area: 4B—Coastal Redwood Belt

Landscape: Mountains

Landform: Alluvial flats and flood terraces

Elevation: 35 to 145 feet (11 to 45 meters)

Mean annual precipitation: 60 to 75 inches (1,520 to 1,900 millimeters)

Mean annual air temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free period: 300 to 330 days

Map Unit Composition

Bigriver silt loam—55 percent
Ferndale—20 percent
Russ—15 percent
Minor components—10 percent

Characteristics of Bigriver and Similar Soils

Slope: 2 to 5 percent
Aspect: South clockwise to west
Landform: Lower alluvial flats; flood plains
Parent material: Alluvium derived from mixed sources
Typical vegetation: The overstory is dominated by redwood (*Sequoia sempervirens*). Small groups or individuals of Sitka spruce (*Picea sitchensis*), western hemlock (*Tsuga heterophylla*), or Douglas-fir (*Pseudotsuga menziesii*) grow in scattered areas throughout the unit. Some grand fir (*Abies grandis*) also grows. The understory is dominated by western swordfern (*Polystichum munitum*) and includes salal (*Gaultheria shallon*), deer fern (*Blechnum spicant*), and redwood-sorrel (*Oxalis oregana*).
Surface area covered by coarse fragments: None
Restrictive feature: None noted
Slowest permeability class: Moderate
Available water capacity to a depth of 60 inches: About 9.8 inches (high)

Hydrologic properties

Present annual flooding: Occasional
Present annual ponding: None
Surface water runoff class: Low
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: B

Interpretive groups

Land capability classification, nonirrigated: 2e-2
Ecological site: F004BX111CA, *Sequoia sempervirens/Polystichum munitum–Oxalis oregana*

Typical profile

A—0 to 15 inches (0 to 39 centimeters); silt loam
C—15 to 63 inches (39 to 159 centimeters); stratified loamy fine sand to silt loam

Characteristics of Ferndale and Similar Soils

Slope: 2 to 5 percent
Aspect: South clockwise to west
Landform: High flood-plain steps
Parent material: Alluvium derived from mixed sources
Typical vegetation: The existing plant community is dominated by sweet vernalgrass (*Anthoxanthum odoratum*), velvetgrass (*Holcus* spp.), silver hairgrass (*Aira caryophyllaea*), tall fescue (*Schedonorus phoenix*), western brackenfern (*Pteridium aquilinum*), and buttercup (*Ranunculus* spp.). A few scattered trees, typically redwood (*Sequoia sempervirens*), Douglas-fir (*Pseudotsuga menziesii*), or red alder (*Alnus rubra*) also grow.
Surface area covered by coarse fragments: None
Restrictive feature: None noted
Slowest permeability class: Moderately slow
Available water capacity to a depth of 60 inches: About 11.7 inches (very high)

Hydrologic properties

Present annual flooding: Rare
Present annual ponding: None
Surface water runoff class: High
Current water table: Present
Natural drainage class: Moderately well drained
Hydrologic soil group: B

Interpretive groups

Land capability classification, nonirrigated: 5e
Ecological site: None assigned

Typical profile

Ap—0 to 7 inches (0 to 19 centimeters); silt loam
C1—7 to 32 inches (19 to 82 centimeters); silt loam
C2—32 to 60 inches (82 to 153 centimeters); silt loam

Characteristics of Russ and Similar Soils

Slope: 2 to 5 percent
Aspect: South clockwise to west
Landform: Lower alluvial flats; flood plains
Parent material: Alluvium derived from mixed sources
Typical vegetation: The existing plant community is dominated by sweet vernalgrass (*Anthoxanthum odoratum*), velvetgrass (*Holcus* spp.), silver hairgrass (*Aira caryophyllea*), tall fescue (*Schedonorus phoenix*), western brackenfern (*Pteridium aquilinum*), and buttercup (*Ranunculus* spp.). A few scattered trees, typically redwood (*Sequoia sempervirens*), Douglas-fir (*Pseudotsuga menziesii*), or red alder (*Alnus rubra*) also grow.
Surface area covered by coarse fragments: 0 to 5 percent coarse, rounded pebbles
Restrictive feature: None noted
Slowest permeability class: Moderate
Available water capacity to a depth of 60 inches: About 8.5 inches (high)

Hydrologic properties

Present annual flooding: Occasional
Present annual ponding: None
Surface water runoff class: Low
Current water table: Present
Natural drainage class: Well drained
Hydrologic soil group: B

Interpretive groups

Land capability classification, nonirrigated: 2e-2
Ecological site: None assigned

Typical profile

A—0 to 10 inches (0 to 25 centimeters); loam
C1—10 to 28 inches (25 to 71 centimeters); loamy coarse sand
C2—28 to 43 inches (71 to 109 centimeters); loamy coarse sand
C3—43 to 60 inches (109 to 152 centimeters); loamy fine sand

Minor Components

Arlynda and similar soils

Composition: About 5 percent
Slope: 2 to 5 percent

Landform: Small, wet depressions on flood plains

Ecological site: None assigned

Riverwash

Composition: About 5 percent

Slope: 0 to 5 percent

Landform: Flats adjacent to the stream channels

Ecological site: None assigned

174—Bigtree-Mystery complex, 2 to 9 percent slopes

Map Unit Setting

General location: Throughout Redwood National and State Parks

Major land resource area: 4B—Coastal Redwood Belt

Landscape: Mountains

Landform: Gently sloping alluvial fans and low terraces

Elevation: 5 to 670 feet (2 to 205 meters)

Mean annual precipitation: 60 to 75 inches (1,520 to 1,900 millimeters)

Mean annual air temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free period: 300 to 320 days

Map Unit Composition

Bigtree—50 percent

Mystery—25 percent

Minor components—25 percent

Characteristics of Bigtree and Similar Soils

Slope: 2 to 9 percent

Aspect: Northwest clockwise to west

Landform: Alluvial fans; fan remnants; low terraces

Parent material: Alluvium derived from mixed sources

Typical vegetation: The overstory is dominated by redwood (*Sequoia sempervirens*).

Small groups or individuals of Sitka spruce (*Picea sitchensis*), western hemlock (*Tsuga heterophylla*), or Douglas-fir (*Pseudotsuga menziesii*) grow in scattered areas throughout the unit. Some grand fir (*Abies grandis*) also grows. The understory is dominated by western swordfern (*Polystichum munitum*) and includes salal (*Gaultheria shallon*), deer fern (*Blechnum spicant*), and redwood-sorrel (*Oxalis oregana*).

Surface area covered by coarse fragments: None

Restrictive feature: None noted

Slowest permeability class: Moderate

Available water capacity to a depth of 60 inches: About 9.9 inches (high)

Hydrologic properties

Present annual flooding: Rare

Present annual ponding: None

Surface water runoff class: Low

Current water table: None noted

Natural drainage class: Well drained

Hydrologic soil group: B

Interpretive groups

Land capability classification, nonirrigated: 2e-2

Ecological site: F004BX111CA, *Sequoia sempervirens/Polystichum munitum*—*Oxalis oregana*

Typical profile

- A—0 to 10 inches (0 to 26 centimeters); loam
- Bw—10 to 47 inches (26 to 120 centimeters); loam
- 2C1—47 to 57 inches (120 to 145 centimeters); sandy loam
- 2C2—57 to 63 inches (145 to 160 centimeters); silt loam

Characteristics of Mystery and Similar Soils

Slope: 2 to 9 percent

Aspect: Northwest clockwise to west

Landform: Alluvial fans; fan remnants; low terraces

Parent material: Overbank alluvium derived from mixed sources

Typical vegetation: The overstory is dominated by redwood (*Sequoia sempervirens*).

Small groups or individuals of Sitka spruce (*Picea sitchensis*), western hemlock (*Tsuga heterophylla*), or Douglas-fir (*Pseudotsuga menziesii*) grow in scattered areas throughout the unit. Some grand fir (*Abies grandis*) also grows. Riverwash

Composition: About 3 percent
Slope: 2 to 9 percent
Landform: Active channels
Ecological site: None assigned

Typic Palehumults and similar soils

Composition: About 3 percent
Slope: 5 to 40 percent
Landform: Older terraces
Ecological site: F004BX103CA, *Sequoia sempervirens*–*Pseudotsuga menziesii*/
Rhododendron macrophyllum

Arents and similar soils

Composition: About 1 percent
Slope: 0 to 4 percent
Landform: Old mill sites on terraces
Ecological site: None assigned

177—Battery, dry, 15 to 50 percent slopes

Map Unit Setting

General location: Along Redwood Creek
Major land resource area: 4B—Coastal Redwood Belt
Landscape: Mountains
Landform: Uplifted, dissected stream terraces
Elevation: 220 to 915 feet (68 to 280 meters)
Mean annual precipitation: 65 to 85 inches (1,650 to 2,160 millimeters)
Mean annual air temperature: 50 to 55 degrees F (10 to 13 degrees C)
Frost-free period: 240 to 300 days

Map Unit Composition

Battery, dry—75 percent
Minor components—25 percent

Characteristics of Battery, Dry, and Similar Soils

Slope: 15 to 50 percent
Aspect: East clockwise to southwest
Landform: Upper, gentler portions of uplifted stream terraces
Parent material: Alluvium derived from mixed sources
Typical vegetation: The overstory is dominated by Douglas-fir (*Pseudotsuga menziesii*) with small amounts of redwood (*Sequoia sempervirens*). Redwood is not present on all sites. A moderate amount of tanoak (*Lithocarpus densiflorus*) and a few Pacific madrone (*Arbutus menziesii*) are in the subcanopy. The understory is dominated by tanoak, salal (*Gaultheria shallon*), and California huckleberry (*Vaccinium ovatum*). Grasses and forbs are either very limited in extent or not present.
Surface area covered by coarse fragments: 0 to 10 percent coarse, rounded pebbles
Restrictive feature: None noted

Soil Survey of Redwood National and State Parks

Slowest permeability class: Moderately slow

Available water capacity to a depth of 60 inches: About 8.3 inches (high)

Hydrologic properties

Present annual flooding: None

Present annual ponding: None

Surface water runoff class: High

Current water table: None noted

Natural drainage class: Well drained

Hydrologic soil group: C

Interpretive groups

Land capability classification, nonirrigated: 4e-1

Ecological site: F004BX102CA, *Pseudotsuga menziesii*–*Sequoia sempervirens*/

Lithocarpus densiflorus

Typical profile

A—0 to 13 inches (0 to 32 centimeters); gravelly clay loam

Bt—13 to 70 inches (32 to 179 centimeters); gravelly clay loam

2C—70 to 79 inches (179 to 200 centimeters); paragravelly clay loam

Minor Components

Typic Palehumults, loamy-skeletal, and similar soils

Composition: About 20 percent

Slope: 5 to 50 percent

Landform: Steeper, loamy portions of uplifted stream terraces

Ecological site: F004BX102CA, *Pseudotsuga menziesii*–*Sequoia sempervirens*/

Lithocarpus densiflorus

Oxyaquic Palehumults and similar soils

Composition: About 5 percent

Slope: 0 to 10 percent

Landform: Depressions on terraces

Ecological site: F004BX103CA, *Sequoia sempervirens*–*Pseudotsuga menziesii*/

Rhododendron macrophyllum

178—Battery, 15 to 50 percent slopes

Map Unit Setting

General location: Along the Smith River and Redwood Creek

Major land resource area: 4B—Coastal Redwood Belt

Landscape: Mountains

Landform: Uplifted, dissected stream terraces

Elevation: 55 to 305 feet (17 to 93 meters)

Mean annual precipitation: 65 to 85 inches (1,650 to 2,160 millimeters)

Mean annual air temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free period: 270 to 290 days

Map Unit Composition

Battery—85 percent

Minor components—15 percent

Characteristics of Battery and Similar Soils

Slope: 15 to 50 percent

Aspect: South clockwise to northwest

Landform: Uplifted, dissected stream terraces

Soil Survey of Redwood National and State Parks

Parent material: Alluvium derived from mixed sources

Typical vegetation: The overstory is dominated by redwood (*Sequoia sempervirens*) with small amounts of Douglas-fir (*Pseudotsuga menziesii*) and western hemlock (*Tsuga heterophylla*). Tanoak (*Lithocarpus densiflorus*) forms the subcanopy. The understory is dominated by Pacific rhododendron (*Rhododendron macrophyllum*), California huckleberry (*Vaccinium ovatum*), and salal (*Gaultheria shallon*). The forb cover is limited.

Surface area covered by coarse fragments: None

2C—51 to 60 inches (130 to 152 centimeters); very gravelly sandy loam

Minor Components

Fluventic Dystrudepts and similar soils

Composition: About 10 percent
Slope: 2 to 9 percent
Landform: Alluvial fans; fan remnants
Ecological site: None assigned

Ferndale and similar soils

Composition: About 5 percent
Slope: 0 to 2 percent
Landform: High flood-plain steps
Ecological site: None assigned

Weott and similar soils

Composition: About 5 percent
Slope: 0 to 2 percent
Landform: Backswamps; depressions; low flood-plain steps
Ecological site: None assigned

Bigriver and similar soils

Composition: About 2 percent
Slope: 0 to 5 percent
Landform: Low flood-plain steps
Ecological site: None assigned

Fluventic Dystrudepts and similar soils

Composition: About 2 percent
Slope: 2 to 9 percent
Landform: Alluvial fans
Ecological site: None assigned

Worswick and similar soils

Composition: About 1 percent
Slope: 0 to 2 percent
Landform: Natural levees
Ecological site: None assigned

251—Surpur, 2 to 9 percent slopes

Map Unit Setting

General location: Flat topped ridge between Freshwater Lagoon and McArthur Creek
Major land resource area: 4B—Coastal Redwood Belt
Landscape: Mountains
Landform: Uplifted, dissected marine terrace remnants
Elevation: 760 to 1,325 feet (233 to 405 meters)
Mean annual precipitation: 80 to 90 inches (2,030 to 2,290 millimeters)
Mean annual air temperature: 50 to 55 degrees F (10 to 13 degrees C)
Frost-free period: 270 to 280 days

Map Unit Composition

Surpur—75 percent
Minor components—25 percent

Characteristics of Surpur and Similar Soils

Slope: 2 to 9 percent

Aspect: Northeast clockwise to southeast

Landform: Moderately broad ridges

Parent material: Colluvium and residuum from weakly consolidated fluvial, beach, and dune deposits derived from mixed sources

Typical vegetation: The overstory is dominated by redwood (*Sequoia sempervirens*) and Douglas-fir (*Pseudotsuga menziesii*) with small amounts of western hemlock (*Tsuga heterophylla*). Tanoak (*Lithocarpus densiflorus*) is present in the subcanopy in places. The understory is dominated by California huckleberry (*Vaccinium ovatum*) and Pacific rhododendron (*Rhododendron macrophyllum*). Tanoak and salal (*Gaultheria shallon*) are present in places. The forb layer is sparse and may consist of western swordfern (*Polystichum munitum*).

Surface area covered by coarse fragments: None

Restrictive feature: None noted

Slowest permeability class: Moderately slow

Available water capacity to a depth of 60 inches: About 11.2 inches (very high)

Hydrologic properties

Present annual flooding: None

Present annual ponding: None

Surface water runoff class: Medium

Current water table: None noted

Natural drainage class: Well drained

Hydrologic soil group: C

Interpretive groups

Land capability classification, nonirrigated: 2e-1

Ecological site: F004BX104CA, *Sequoia sempervirens*–*Pseudotsuga menziesii*/
Rhododendron macrophyllum

Typical profile

Oi—0 to 2 inches (0 to 5 centimeters); slightly decomposed plant material

A—2 to 14 inches (5 to 36 centimeters); loam

BA—14 to 22 inches (36 to 57 centimeters); silt loam

Bt—22 to 33 inches (57 to 85 centimeters); silty clay loam

2BC—33 to 79 inches (85 to 200 centimeters); silty clay loam

Minor Components

Tectah and similar soils

Composition: About 10 percent

Slope: 2 to 9 percent

Landform: Summits of ridges

Ecological site: F004BX103CA, *Sequoia sempervirens*–*Pseudotsuga menziesii*/
Rhododendron macrophyllum

Fortyfour and similar soils

Composition: About 5 percent

Slope: 2 to 9 percent

Rhododendron macrophyllum

289—Espa, 2 to 9 percent slopes

Map Unit Setting

General location: North of Orick and Skunk Cabbage Creek and west of Highway 101

Major land resource area: 4B—Coastal Redwood Belt

Landscape: Hills

Landform: Uplifted, dissected marine terrace remnants

Elevation: 160 to 740 feet (49 to 227 meters)

Mean annual precipitation: 60 to 75 inches (1,520 to 1,900 millimeters)

Mean annual air temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free period: 280 to 325 days

Map Unit Composition

Espa—80 percent

Minor components—20 percent

Characteristics of Espa and Similar Soils

Slope: 2 to 9 percent

Aspect: North clockwise to southwest

Landform: Broad ridgetops and upper hillslopes

Parent material: Colluvium and residuum derived from weakly consolidated fluvial, beach, and dune deposits

Typical vegetation: The overstory is dominated by redwood (*Sequoia sempervirens*). Disturbance has modified the composition of the species on some sites, leading to moderate amounts of Douglas-fir (*Pseudotsuga menziesii*). Western hemlock (*Tsuga heterophylla*) is also present in very small amounts. The understory is dominated by western swordfern (*Polystichum munitum*) and redwood-sorrel (*Oxalis oregana*). The shrub layer, though sparse, consists of California huckleberry (*Vaccinium ovatum*) and a limited amount of salal (*Gaultheria shallon*).

Characteristics of Squashan and Similar Soils

Slope: 9 to 30 percent
Aspect: South clockwise to northeast
Landform: Upper hillslopes
Parent material: Colluvium and residuum from weakly consolidated fluvial, beach, and dune deposits derived from mixed sources
Typical vegetation: The overstory is dominated by redwood (*Sequoia sempervirens*). Disturbance has modified the composition of the species on some sites, leading to moderate amounts of Douglas-fir (*Pseudotsuga menziesii*). Western hemlock (*Tsuga heterophylla*) is also present in very small amounts. The understory is dominated by western swordfern (*Polystichum munitum*) and redwood-sorrel (*Oxalis oregana*). The shrub layer, though sparse, consists of California huckleberry (*Vaccinium ovatum*) and a limited amount of salal (*Gaultheria shallon*).
Surface area covered by coarse fragments: 0 to 30 percent coarse, well rounded pebbles and 0 to 30 percent well rounded cobbles
Restrictive feature: None noted
Slowest permeability class: Moderately slow
Available water capacity to a depth of 60 inches: About 6.4 inches (moderate)

Hydrologic properties

Present annual flooding: None
Present annual ponding: None
Surface water runoff class: Medium
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: C

Interpretive groups

294—Ossagon-Goldbluffs-Squashan complex, 30 to 50 percent slopes

Map Unit Setting

General location: North of Orick, along the west side of Highway 101 as it passes through Prairie Creek Redwoods State Park west to the ocean

Major land resource area: 4B—Coastal Redwood Belt

Landscape: Hills (fig. 11)

Landform: Steep hillsides and narrow spur ridges

Elevation: 15 to 1,010 feet (6 to 309 meters)

Mean annual precipitation: 60 to 80 inches (1,520 to 2,030 millimeters)

Mean annual air temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free period: 260 to 325 days

Map Unit Composition

Ossagon—35 percent

Goldbluffs—20 percent

Squashan—15 percent

Minor components—30 percent

Figure 11.—An area of Ossagon-Goldbuffs-Squashan complex, 30 to 50 percent slopes. The dominant vegetation consists of redwood, Douglas-fir, western hemlock, California huckleberry, redwood-sorrel, and swordfern.

Characteristics of Ossagon and Similar Soils

Slope: 30 to 50 percent

Aspect: North clockwise to northwest

Landform: Hillslopes

Parent material: Colluvium and residuum from weakly consolidated fluvial, beach, and dune deposits derived from mixed sources

Soil Survey of Redwood National and State Parks

Typical vegetation: The overstory is dominated by redwood (*Sequoia sempervirens*). Disturbance has modified the composition of the species on some sites, leading to moderate amounts of Douglas-fir (*Pseudotsuga menziesii*). Western hemlock (*Tsuga heterophylla*) is also present in very small amounts. The understory is dominated by western swordfern (*Polystichum munitum*) and redwood-sorrel (*Oxalis oregana*). The shrub layer, though sparse, consists of California huckleberry (*Vaccinium ovatum*) and a limited amount of salal (*Gaultheria shallon*).

Surface area covered by coarse fragments: None

Restrictive feature: None noted

Slowest permeability class: Moderately slow

Available water capacity to a depth of 60 inches: About 9.9 inches (high)

Hydrologic properties

Present annual flooding: None

Present annual ponding: None

Surface water runoff class: High

Current water table: None noted

Natural drainage class: Well drained

Hydrologic soil group: B

Interpretive groups

Land capability classification, nonirrigated: 6e

Ecological site: F004BX107CA, *Sequoia sempervirens/Polystichum munitum*

Typical profile

Oi—0 to 4 inches (0 to 10 centimeters); slightly decomposed plant material

A—4 to 12 inches (10 to 31 centimeters); loam

ABt—12 to 16 inches (31 to 41 centimeters); clay loam

Bt—16 to 48 inches (41 to 121 centimeters); clay loam

CBt—48 to 79 inches (121 to 200 centimeters); sandy loam

Characteristics of Goldbluffs and Similar Soils

Slope: 30 to 50 percent

Aspect: North clockwise to northwest

Landform: Narrow ridges on hillslopes

Parent material: Colluvium and residuum from weakly consolidated fluvial and beach deposits derived from mixed sources

Typical vegetation: The overstory is dominated by redwood (*Sequoia sempervirens*) with moderate amounts of Douglas-fir (*Pseudotsuga menziesii*). Sitka spruce (*Picea sitchensis*) is present in limited amounts and replaces Douglas-fir on some sites close to the coast. The understory is dominated by California huckleberry (*Vaccinium ovatum*). Salal (*Gaultheria shallon*) is present in some areas in small amounts. The ground cover is dominated by western swordfern (*Polystichum munitum*) and redwood-sorrel (*Oxalis oregana*).

Surface area covered by coarse fragments: 0 to 5 percent well rounded cobbles and 0 to 20 percent coarse, well rounded pebbles

Restrictive feature: None noted

Slowest permeability class: Moderate

Available water capacity to a depth of 60 inches: About 4.6 inches (low)

Landscape: Mountains

Landform: Steep and very steep mountain slopes

Elevation: 1,135 to 3,275 feet (347 to 999 meters)

Mean annual precipitation: 90 to 100 inches (2,290 to 2,550 millimeters)

Mean annual air temperature: 50 to 59 degrees F (10 to 15 degrees C)

Frost-free period: 200 to 250 days

Map Unit Composition

Dolason—55 percent

Countshill—30 percent

Minor components—15 percent

Characteristics of Dolason and Similar Soils

Slope: 30 to 50 percent

Aspect: South clockwise to west

Landform: Mountain slopes

Parent material: Colluvium and residuum weathered from siltstone and sandstone

Typical vegetation: The existing plant community is dominated by herbaceous species, such as tall oatgrass (*Arrhenatherum elatius*), annual vernalgrass (*Anthoxanthum aristatum*), bentgrass (*Agrostis*), and bristly dogstail grass (*Cynosurus echinatus*). Forbs include common sheep sorrel (*Rumex acetosella*) and hairy cat's ear (*Hypochaeris radicata*). Western brackenfern (*Pteridium aquilinum*), a native forb, grows on some sites.

Surface area covered by coarse fragments: 0 to 12 percent coarse, subangular pebbles and 0 to 3 percent subangular cobbles

Restrictive feature: None noted

Slowest permeability class: Moderate

Available water capacity to a depth of 60 inches: About 7.6 inches (high)

Hydrologic properties

Present annual flooding: None

Soil Survey of Redwood National and State Parks

Present annual ponding: None
Surface water runoff class: High
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: B

Interpretive groups

Land capability classification, nonirrigated: 6e
Ecological site: R004BX101CA, Upper prairie, mountain slopes, sandstone and mudstone, clay loam

Typical profile

A1—0 to 13 inches (0 to 33 centimeters); loam
A2—13 to 21 inches (33 to 53 centimeters); gravelly loam
Bw—21 to 44 inches (53 to 113 centimeters); very gravelly loam
C—44 to 59 inches (113 to 150 centimeters); very gravelly loam

Characteristics of Countshill and Similar Soils

Slope: 30 to 50 percent
Aspect: South clockwise to west
Landform: Convex slopes and spur ridges
Parent material: Colluvium and residuum weathered from siltstone and sandstone
Typical vegetation: The existing plant community is dominated by herbaceous species, such as tall oatgrass (*Arrhenatherum elatius*), annual vernalgrass (*Anthoxanthum aristatum*), bentgrass (*Agrostis*), and bristly dogstail grass (*Cynosurus echinatus*). Forbs include common sheep sorrel (*Rumex acetosella*) and hairy cat's ear (*Hypochaeris radicata*). Western brackenfern (*Pteridium aquilinum*), a native forb, grows on some sites.
Surface area covered by coarse fragments: None
Depth to restrictive feature: 24 to 35 inches to paralithic bedrock
Slowest permeability class: Moderate above the bedrock
Available water capacity to a depth of 60 inches: About 5.3 inches (moderate)

Hydrologic properties

Present annual flooding: None
Present annual ponding: None
Surface water runoff class: High
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: C

Interpretive groups

Land capability classification, nonirrigated: 6e
Ecological site: R004BX101CA, Upper prairie, mountain slopes, sandstone and mudstone, clay loam

Typical profile

A1—0 to 3 inches (0 to 8 centimeters); gravelly loam
A2—3 to 24 inches (8 to 60 centimeters); loam
AC—24 to 30 inches (60 to 75 centimeters); very gravelly loam
Cr—30 to 60 inches (75 to 152 centimeters); soft bedrock

Minor Components

Oxyaquic Dystrocherepts and similar soils

Composition: About 10 percent
Slope: 30 to 50 percent

Landform: Small slumps and hollows at the heads of drainages on mountain slopes
Ecological site: R004BX101CA, Upper prairie, mountain slopes, sandstone and mudstone, clay loam

Rock outcrop

Composition: About 5 percent
Slope: 30 to 50 percent
Landform: Very steep, strongly convex mountain slopes
Ecological site: None assigned

483—Doolyville-Pasturerock complex, 30 to 50 percent slopes

Map Unit Setting

General location: Steep, lower mountain slopes east of Redwood Creek
Major land resource area: 4B—Coastal Redwood Belt
Landscape: Mountains
Landform: Steep, lower mountain slopes. Vertical drainage in the substratum is impaired. During the rainy season, ground water is perched and seeps downslope more or less parallel to the ground surface.
Elevation: 170 to 2,950 feet (53 to 900 meters)
Mean annual precipitation: 70 to 85 inches (1,780 to 2,160 millimeters)
Mean annual air temperature: 50 to 59 degrees F (10 to 15 degrees C)
Frost-free period: 240 to 270 days

Map Unit Composition

Doolyville—40 percent
Pasturerock—35 percent
Minor components—25 percent

Characteristics of Doolyville and Similar Soils

Slope: 30 to 50 percent
Aspect: Southeast clockwise to southwest
Landform: Smooth to rounded slopes; along poorly incised drainages; earthflows
Parent material: Earthflow deposits derived from mudstone and sandstone
Typical vegetation: The existing plant community is dominated by Oregon white oak (*Quercus garryana*) with an understory of orchardgrass (*Dactylis glomerata*), woodland strawberry (*Fragaria vesca*), sanicle (*Sanicula* spp.), and vetch (*Vicia* spp.).
Surface area covered by coarse fragments: None
Restrictive feature: None noted
Slowest permeability class: Very slow
Available water capacity to a depth of 60 inches: About 8.5 inches (high)

Hydrologic properties

Present annual flooding: None
Present annual ponding: None
Surface water runoff class: Very high
Current water table: Present
Natural drainage class: Somewhat poorly drained
Hydrologic soil group: D

Interpretive groups

Land capability classification, nonirrigated: 6e
Ecological site: F004BX112CA, *Quercus garryana/Dactylis glomerata*

Typical profile

Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material
A—1 to 6 inches (3 to 15 centimeters); silt loam
ABt—6 to 11 inches (15 to 28 centimeters); silty clay loam
Bt—11 to 15 inches (28 to 37 centimeters); silty clay loam
Btg—15 to 18 inches (37 to 46 centimeters); gravelly silty clay loam
Cg—18 to 61 inches (46 to 155 centimeters); very gravelly loam

Characteristics of Pasturerock and Similar Soils

Slope: 30 to 50 percent

Aspect: Southeast clockwise to southwest

Landform: Raised areas; along well incised streams; mountain slopes

Parent material: Colluvium derived from sandstone and mudstone

Typical vegetation: The overstory of the existing plant community is dominated by Oregon white oak (*Quercus garryana*). The understory is dominated by bristly dogstail grass (*Cynosurus echinatus*) and woodland strawberry (*Fragaria vesca*). The shrub cover is of limited extent and may include creeping snowberry (*Symphoricarpos mollis*) and Pacific poison oak (*Toxicodendron diversilobum*).

Surface area covered by coarse fragments: None

Restrictive feature: None noted

Slowest permeability class: Moderately slow

Available water capacity to a depth of 60 inches: About 7.7 inches (high)

Hydrologic properties

Present annual flooding: None

Present annual ponding: None

Surface water runoff class: High

Current water table: None noted

Natural drainage class: Well drained

Hydrologic soil group: C

Interpretive groups

Land capability classification, nonirrigated: 6e

Ecological site: F004BX114CA, *Quercus garryana/Cynosurus echinatus*

Typical profile

Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material
A—1 to 8 inches (3 to 20 centimeters); loam
AB—8 to 17 inches (20 to 42 centimeters); gravelly clay loam
Bt—17 to 55 inches (42 to 140 centimeters); gravelly clay loam
BCt—55 to 68 inches (140 to 172 centimeters); gravelly clay loam

Minor Components

Aquic Hapludalfs and similar soils

Composition: About 10 percent

Slope: 30 to 50 percent

Landform: Irregular slopes that have more rapid earthflow activity than the major soils; earthflows

Ecological site: F004BX112CA, *Quercus garryana/Dactylis glomerata*

Rock outcrop

Composition: About 10 percent

Slope: 30 to 50 percent

Landform: Very steep, strongly convex mountain slopes

Ecological site: None assigned

Dystroxerepts and similar soils

Composition: About 5 percent

Slope: 30 to 50 percent

Landform: Very steep, strongly convex mountain slopes

Ecological site: F004BX114CA, *Quercus garryana/Cynosurus echinatus*

484—Elkcamp-Dolason-Airstrip complex, 15 to 50 percent slopes

Map Unit Setting

General location: Bald Hills area

Major land resource area: 4B—Coastal Redwood Belt

Landscape: Mountains

Landform: Interspersed smooth and hummocky or irregular mountain slopes (fig. 12).

The hummocky and irregular areas are slow-moving earthflows. Vertical drainage is impaired in the substratum in some of the soils.

Elevation: 610 to 3,230 feet (187 to 985 meters)

Mean annual precipitation: 90 to 100 inches (2,290 to 2,550 millimeters)

Mean annual air temperature: 50 to 59 degrees F (10 to 15 degrees C)

Frost-free period: 200 to 250 days

Map Unit Composition

Elkcamp—50 percent

Dolason—30 percent

Airstrip—15 percent

Minor components—5 percent

Figure 12.—An area of Elkcamp-Dolason-Airstrip complex, 15 to 50 percent slopes. The dominant vegetation consists of grasses and forbs. Forest encroachment is occurring along prairie margins and in drainageways.

Characteristics of Elkcamp and Similar Soils

Slope: 15 to 50 percent

Aspect: Southeast clockwise to west

Landform: Irregular mountain slopes

Parent material: Earthflow deposits derived from sandstone, mudstone, and siltstone

Typical vegetation: The existing plant community is dominated by blue wildrye (*Elymus glaucus*), soft brome (*Bromus hordeaceus*), tall oatgrass (*Arrhenatherum elatius*), and bristly dogstail grass (*Cynosurus echinatus*). Scotch broom (*Cytisus scoparius*) grows on some sites.

Surface area covered by coarse fragments: 0 to 15 percent coarse, subangular pebbles

Restrictive feature: None noted

Slowest permeability class: Moderately slow

Available water capacity to a depth of 60 inches: About 8.9 inches (high)

Hydrologic properties

Present annual flooding: None

Present annual ponding: None

Surface water runoff class: High

Current water table: Present

Natural drainage class: Well drained

Hydrologic soil group: C

Interpretive groups

Land capability classification, nonirrigated: 6e

Ecological site: R004BX104CA, Middle prairie, mountain slopes, sandstone and mudstone, gravelly clay loam

Typical profile

A—0 to 8 inches (0 to 20 centimeters); loam

ABt—8 to 21 inches (20 to 54 centimeters); gravelly loam

Bt1—21 to 37 inches (54 to 95 centimeters); gravelly clay loam

Bt2—37 to 49 inches (95 to 125 centimeters); gravelly clay loam

Bt3—49 to 65 inches (125 to 166 centimeters); very gravelly clay loam

Characteristics of Dolason and Similar Soils

Slope: 15 to 50 percent

Aspect: Southeast clockwise to west

Landform: Mountain slopes

Parent material: Colluvium and residuum weathered from siltstone and sandstone

Typical vegetation: The existing plant community is dominated by herbaceous species, such as tall oatgrass (*Arrhenatherum elatius*), annual vernalgrass (*Anthoxanthum aristatum*), bentgrass (*Agrostis*), and bristly dogstail grass (*Cynosurus echinatus*). Forbs include common sheep sorrel (*Rumex acetosella*) and hairy cat's ear (*Hypochaeris radicata*). Western brackenfern (*Pteridium aquilinum*), a native forb, grows on some sites.

Surface area covered by coarse fragments: 0 to 12 percent coarse, subangular pebbles

Restrictive feature: None noted

Slowest permeability class: Moderate

Available water capacity to a depth of 60 inches: About 7.2 inches (moderate)

Hydrologic properties

Present annual flooding: None

Present annual ponding: None

Surface water runoff class: High

Soil Survey of Redwood National and State Parks

Current water table: None noted

Typical profile

A1—0 to 13 inches (0 to 33 centimeters); loam
A2—13 to 21 inches (33 to 53 centimeters); gravelly loam
Bw—21 to 44 inches (53 to 113 centimeters); very gravelly loam
C—44 to 59 inches (113 to 150 centimeters); very gravelly loam

Characteristics of Airstrip and Similar Soils

Slope: 15 to 50 percent
Aspect: Southeast clockwise to west
Landform: Narrow spur ridges
Parent material: Colluvium and residuum weathered from sandstone and siltstone
Typical vegetation: The existing plant community is dominated by herbaceous species, such as tall oatgrass (*Arrhenatherum elatius*), annual vernalgrass (*Anthoxanthum aristatum*), bentgrass (*Agrostis*), and bristly dogstail grass (*Cynosurus echinatus*). Forbs include common sheep sorrel (*Rumex acetosella*) and hairy cat's ear (*Hypochaeris radicata*). Western brackenfern (*Pteridium aquilinum*), a native forb, grows on some sites.
Surface area covered by coarse fragments: 15 to 35 percent coarse, subangular pebbles and 0 to 5 percent subangular cobbles
Depth to restrictive feature: 20 to 40 inches to lithic bedrock
Slowest permeability class: Moderate above the bedrock
Available water capacity to a depth of 60 inches: About 3.7 inches (low)

Hydrologic properties

Present annual flooding: None
Present annual ponding: None
Surface water runoff class: High
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: B

Interpretive groups

Land capability classification, nonirrigated: 6e
Ecological site: R004BX101CA, Upper prairie, mountain slopes, sandstone and mudstone, clay loam

Typical profile

A—0 to 14 inches (0 to 36 centimeters); gravelly loam
Bw—14 to 31 inches (36 to 80 centimeters); very gravelly loam
R—31 to 60 inches (80 to 152 centimeters); bedrock

Minor Components

Raingage, cool, and similar soils

Composition: About 3 percent
Slope: 15 to 50 percent
Landform: Slow moving portions of earthflow
Ecological site: R004BX103CA, Lower prairie, earthflows, sandstone and mudstone, gravelly loam

Rock outcrop

Composition: About 2 percent

Slope: 30 to 50 percent

Landform: Very steep, strongly convex mountain slopes

Ecological site: None assigned

485—Pasturerock-Coyoterock-Maneze complex, 30 to 50 percent slopes

Map Unit Setting

General location: Steep, upper mountain slopes east of the lower Redwood Creek basin

Major land resource area: 4B—Coastal Redwood Belt

Landscape: Mountains

Landform: Steep mountain slopes. Vertical drainage is impaired in the substratum in some of the soils.

Elevation: 515 to 3,160 feet (158 to 964 meters)

Mean annual precipitation: 90 to 100 inches (2,290 to 2,550 millimeters)

Mean annual air temperature: 50 to 59 degrees F (10 to 15 degrees C)

Frost-free period: 200 to 260 days

Map Unit Composition

Pasturerock—40 percent

Coyoterock—25 percent

Maneze—15 percent

Minor components—20 percent

Characteristics of Pasturerock and Similar Soils

Slope: 15 to 50 percent

Aspect: East clockwise to northwest

Landform: Shoulders of spur ridges; near deeply incised drainages; mountain slopes

Parent material: Colluvium derived from sandstone and mudstone

Typical vegetation: The overstory of the existing plant community is dominated by Oregon white oak (*Quercus garryana*). The understory is dominated by bristly dogstail grass (*Cynosurus echinatus*) and woodland strawberry (*Fragaria vesca*). The shrub cover is of limited extent and may include creeping snowberry (*Symphoricarpos mollis*) and Pacific poison oak (*Toxicodendron diversilobum*).

Surface area covered by coarse fragments: None

Restrictive feature: None noted

Slowest permeability class: Slow

Available water capacity to a depth of 60 inches: About 8.2 inches (high)

Hydrologic properties

Present annual flooding: None

Present annual ponding: None

Surface water runoff class: High

Current water table: None noted

Natural drainage class: Well drained

Hydrologic soil group: C

Cg—47 to 71 inches (120 to 180 centimeters); very gravelly clay loam

Minor Components

Lacks creek and similar soils

Composition: About 3 percent

Slope: 30 to 50 percent

Landform: Around small rock outcrops or “knockers” on mountain slopes

Ecological site: F004BX103CA, *Sequoia sempervirens–Pseudotsuga menziesii/Rhododendron macrophyllum*

Slide creek, wet substratum, and similar soils

Composition: About 3 percent

Slope: 30 to 50 percent

Landform: Along streams and in moist, downslope-running concavities on mountain slopes

Ecological site: F004BX103CA, *Sequoia sempervirens–Pseudotsuga menziesii/Rhododendron macrophyllum*

Fluents and similar soils

Composition: About 2 percent

Slope: 0 to 15 percent

Landform: Active channels

Ecological site: None assigned

Rock outcrop

Composition: About 2 percent

Slope: 30 to 50 percent

Landform: Very steep, strongly convex mountain slopes

Ecological site: None assigned

533—Coppercreek-Ahpah complex, 15 to 30 percent slopes

Map Unit Setting

General location: Headwaters of drainage basins west of Redwood Creek

Major land resource area: 4B—Coastal Redwood Belt

Landscape: Mountains

Landform: Moderately steep, broad, north-trending spur ridges

Elevation: 380 to 2,765 feet (116 to 844 meters)

Mean annual precipitation: 80 to 95 inches (2,030 to 2,410 millimeters)

Mean annual air temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free period: 245 to 285 days

Map Unit Composition

Coppercreek—60 percent

Ahpah—15 percent

Minor components—25 percent

Characteristics of Coppercreek and Similar Soils

Slope: 15 to 30 percent

Aspect: North clockwise to southeast

Landform: Shoulders of broad ridges

Parent material: Colluvium and residuum derived from schist

Typical vegetation: The overstory is dominated by redwood (*Sequoia sempervirens*) and Douglas-fir (*Pseudotsuga menziesii*) with tanoak (*Lithocarpus densiflorus*) in the subcanopy. Western hemlock (*Tsuga heterophylla*) is present in some places. The understory is dominated by Pacific rhododendron (*Rhododendron macrophyllum*), California huckleberry (*Vaccinium ovatum*), and small amounts of salal (*Gaultheria shallon*). The cover of grasses and forbs is limited.

Surface area covered by coarse fragments: None

Restrictive feature: None noted

Slowest permeability class: Moderately slow

Available water capacity to a depth of 60 inches: About 8.3 inches (high)

Hydrologic properties

Present annual flooding: None

Present annual ponding: None

Surface water runoff class: Medium

Current water table: None noted

Natural drainage class: Well drained

Hydrologic soil group: C

Interpretive groups

Land capability classification, nonirrigated: 4e-1

Ecological site: F004BX101CA, *Sequoia sempervirens*–*Pseudotsuga menziesii*/
Rhododendron macrophyllum

Typical profile

Oi—0 to 0.5 inch (0 to 1 centimeter); slightly decomposed plant material

A—0.5 to 3 inches (1 to 7 centimeters); gravelly loam

BA—3 to 13 inches (7 to 32 centimeters); gravelly loam

Bt1—13 to 41 inches (32 to 103 centimeters); gravelly silty clay loam

Bt2—41 to 62 inches (103 to 157 centimeters); very gravelly silty clay loam

Characteristics of Ahpah and Similar Soils

Slope: 15 to 30 percent

Aspect: North clockwise to southeast

Landform: Tops of ridges

Parent material: Residuum and colluvium derived from schist

Typical vegetation: The overstory is dominated by redwood (*Sequoia sempervirens*) and Douglas-fir (*Pseudotsuga menziesii*) with tanoak (*Lithocarpus densiflorus*) in the subcanopy. Western hemlock (*Tsuga heterophylla*) is present in some places. The understory is dominated by Pacific rhododendron (*Rhododendron macrophyllum*), California huckleberry (*Vaccinium ovatum*), and small amounts of salal (*Gaultheria shallon*). The cover of grasses and forbs is limited.

Surface area covered by coarse fragments: None

Depth to restrictive feature: 20 to 39 inches to paralithic bedrock; 39 to 60 inches to lithic bedrock

Slowest permeability class: Moderately slow above the bedrock

Available water capacity to a depth of 60 inches: About 4.2 inches (low)

Hydrologic properties

Present annual flooding: None

Present annual ponding: None

Surface water runoff class: Medium
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: C

Interpretive groups

Land capability classification, nonirrigated: 4e-8

Characteristics of Ladybird and Similar Soils

Slope: 30 to 50 percent
Aspect: South clockwise to east
Landform: Mountain slopes
Parent material: Colluvium and residuum derived from schist

Soil Survey of Redwood National and State Parks

Typical vegetation: The overstory is dominated by redwood (*Sequoia sempervirens*) with small amounts of Douglas-fir (*Pseudotsuga menziesii*), western hemlock (*Tsuga heterophylla*), and red alder (*Alnus rubra*). Douglas-fir is not present on all sites, and Sitka spruce (*Picea sitchensis*) is the more common species in many places near the coast. The understory is dominated by western swordfern (*Polystichum munitum*) with some patches of California huckleberry (*Vaccinium ovatum*) or salmonberry (*Rubus spectabilis*) and salal (*Gaultheria shallon*).

Surface area covered by coarse fragments: None

Restrictive feature: None noted

Slowest permeability class: Moderately slow

Available water capacity to a depth of 60 inches: About 8.4 inches (high)

Hydrologic properties

Present annual flooding: None

Present annual ponding: None

Surface water runoff class: High

Current water table: None noted

Natural drainage class: Well drained

Hydrologic soil group: C

Interpretive groups

Land capability classification, nonirrigated: 6e

Ecological site: F004BX108CA, *Sequoia sempervirens/Polystichum munitum*

Typical profile

Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material

A1—1 to 5 inches (3 to 13 centimeters); gravelly loam

A2—5 to 9 inches (13 to 24 centimeters); gravelly clay loam

BAt—9 to 24 inches (24 to 61 centimeters); very gravelly silty clay loam

Bt—24 to 51 inches (61 to 130 centimeters); gravelly clay loam

BCt1—51 to 61 inches (130 to 155 centimeters); gravelly loam

BCt2—61 to 76 inches (155 to 193 centimeters); very gravelly loam

Characteristics of Stonehill and Similar Soils

Slope: 30 to 50 percent

Aspect: South clockwise to east

Landform: Steeper, more strongly convex mountain slopes

Parent material: Residuum and colluvium derived from schist

Typical vegetation: The overstory is dominated by redwood (*Sequoia sempervirens*) with small amounts of Douglas-fir (*Pseudotsuga menziesii*), western hemlock (*Tsuga heterophylla*), and red alder (*Alnus rubra*). Douglas-fir is not present on all sites, and Sitka spruce (*Picea sitchensis*) is the more common species in many places near the coast. The understory is dominated by western swordfern (*Polystichum munitum*) with some patches of California huckleberry (*Vaccinium ovatum*) or salmonberry (*Rubus spectabilis*) and salal (*Gaultheria shallon*).

Surface area covered by coarse fragments: None

Depth to restrictive feature: 20 to 40 inches to lithic bedrock

Slowest permeability class: Moderately slow above the bedrock

Available water capacity to a depth of 60 inches: About 6.6 inches (moderate)

Hydrologic properties

Present annual flooding: None

Present annual ponding: None

Surface water runoff class: High

Current water table: None noted

Natural drainage class: Well drained

Hydrologic soil group: C

Interpretive groups

Land capability classification, nonirrigated: 6e

Ecological site: F004BX108CA, *Sequoia sempervirens/Polystichum munitum*

Typical profile

- Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material
- Oa—1 to 5 inches (3 to 13 centimeters); highly decomposed plant material
- A—5 to 20 inches (13 to 52 centimeters); cobbly silt loam
- BAt—20 to 25 inches (52 to 64 centimeters); cobbly silty clay loam
- Bt—25 to 32 inches (64 to 82 centimeters); gravelly silty clay loam
- R—32 to 60 inches (82 to 152 centimeters); bedrock

Minor Components

Devils Creek and similar soils

Composition: About 10 percent

Slope: 30 to 50 percent

Landform: Near seeps and in low, wet places near intermittent streams; mountain slopes

Ecological site: F004BX108CA, *Sequoia sempervirens/Polystichum munitum*

Panther Creek and similar soils

Composition: About 7 percent

Slope: 30 to 50 percent

Landform: Near seeps and in low, wet places near intermittent streams; mountain slopes

Ecological site: F004BX108CA, *Sequoia sempervirens/Polystichum munitum*

Fluents and similar soils

Composition: About 3 percent

Slope: 0 to 15 percent

Landform: Active channels

Ecological site: None assigned

554—Ladybird-Trailhead complex, 15 to 30 percent slopes

Map Unit Setting

General location: Lower Redwood Creek basin, in and around Orick Valley

Major land resource area: 4B—Coastal Redwood Belt

Landscape: Mountains

Landform: Moderately steep, north- to northeast-trending ridges

Elevation: 45 to 1,085 feet (15 to 332 meters)

Mean annual precipitation: 70 to 80 inches (1,780 to 2,030 millimeters)

Mean annual air temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free period: 250 to 290 days

Map Unit Composition

Ladybird—50 percent

Trailhead—25 percent

Minor components—25 percent

Characteristics of Ladybird and Similar Soils

Slope: 15 to 30 percent

Aspect: Northwest clockwise to northeast

Landform: Shoulders of narrow ridges

Soil Survey of Redwood National and State Parks

Parent material: Colluvium and residuum derived from schist

Typical vegetation: The overstory is dominated by redwood (*Sequoia sempervirens*) with small amounts of Douglas-fir (*Pseudotsuga menziesii*), western hemlock (*Tsuga heterophylla*), and red alder (*Alnus rubra*). Douglas-fir is not present on all sites, and Sitka spruce (*Picea sitchensis*) is the more common species in many places near the coast. The understory is dominated by western swordfern (*Polystichum munitum*) with some patches of California huckleberry (*Vaccinium ovatum*) or salmonberry (*Rubus spectabilis*) and salal (*Gaultheria shallon*).

Surface area covered by coarse fragments: None

AB—24 to 30 inches (60 to 77 centimeters); silty clay loam
BA_t—30 to 38 inches (77 to 97 centimeters); silty clay
B_t1—38 to 54 inches (97 to 137 centimeters); silty clay
B_t2—54 to 66 inches (137 to 167 centimeters); clay

Minor Components

Coppercreek and similar soils

Composition: About 13 percent
Slope: 15 to 30 percent
Landform: Shoulders and upper mountain slopes
Ecological site: F004BX101CA, *Sequoia sempervirens–Pseudotsuga menziesii/Rhododendron macrophyllum*

Tectah and similar soils

Composition: About 12 percent
Slope: 15 to 30 percent
Landform: Broader portions of ridges
Ecological site: F004BX101CA, *Sequoia sempervirens–Pseudotsuga menziesii/Rhododendron macrophyllum*

555—Panthercreek-Devils creek-Coppercreek complex, 50 to 75 percent slopes

Map Unit Setting

General location: Mountain slopes west of Redwood Creek
Major land resource area: 4B—Coastal Redwood Belt
Landscape: Mountains
Landform: Very steep, wet, inner-gorge mountain slopes. The slopes are scarred by landslides that occurred during recent floods and are strewn with large fallen logs and debris. Tree grow rapidly, and windfalls are frequent.
Elevation: 50 to 2,155 feet (16 to 657 meters)
Mean annual precipitation: 70 to 90 inches (1,780 to 2,290 millimeters)
Mean annual air temperature: 50 to 55 degrees F (10 to 13 degrees C)
Frost-free period: 250 to 300 days

Map Unit Composition

Panthercreek—35 percent
Devils creek—20 percent
Coppercreek—20 percent
Minor components—25 percent

Characteristics of Panthercreek and Similar Soils

Slope: 50 to 75 percent
Aspect: Southwest clockwise to east

Soil Survey of Redwood National and State Parks

Landform: On scars and deposits from recent debris flow and debris slides

Parent material: Debris slide deposits derived from schist

Typical vegetation: The overstory is dominated by redwood (*Sequoia sempervirens*) with small amounts of Douglas-fir (*Pseudotsuga menziesii*), western hemlock (*Tsuga heterophylla*), and red alder (*Alnus rubra*). Douglas-fir is not present on all sites, and Sitka spruce (*Picea sitchensis*) is the more common species in many places near the coast. Present annual flooding: None

Present annual ponding: None

Surface water runoff class: Medium

Current water table: None noted

Natural drainage class: Well drained

Hydrologic soil group: C

Interpretive groups

Land capability classification, nonirrigated: 4e-5

Ecological site: F004BX104CA, *Sequoia sempervirens*–*Pseudotsuga menziesii*/
Rhododendron macrophyllum

Typical profile

A—0 to 4 inches (0 to 11 centimeters); silty clay loam

AB—4 to 15 inches (11 to 38 centimeters); silty clay loam

Bt1—15 to 30 inches (38 to 76 centimeters); silty clay

Bt2—30 to 79 inches (76 to 200 centimeters); clay

Minor Components

Slidecreek and similar soils

Composition: About 10 percent

Slope: 30 to 50 percent

Landform: Steeper slopes on ridges

Ecological site: F004BX103CA, *Sequoia sempervirens*–*Pseudotsuga menziesii*/
Rhododendron macrophyllum

Fortyfour and similar soils

Composition: About 5 percent

Slope: 0 to 30 percent

Landform: Convex positions on crests of ridges

Ecological site: F004BX104CA, *Sequoia sempervirens*–*Pseudotsuga menziesii*/
Rhododendron macrophyllum

559—Trailhead, 0 to 9 percent slopes

Map Unit Setting

General location: Ridgetops west of Redwood Creek

Major land resource area: 4B—Coastal Redwood Belt

Landscape: Mountains

Landform: Broad, undulating ridgetops

Elevation: 1,285 to 2,380 feet (393 to 726 meters)

Mean annual precipitation: 90 to 100 inches (2,290 to 2,550 millimeters)

Mean annual air temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free period: 250 to 270 days

Map Unit Composition

Trailhead—85 percent

Minor components—15 percent

Characteristics of Trailhead and Similar Soils

Slope: 0 to 9 percent

Aspect: South clockwise to northeast

Landform: Broad, undulating ridges

Parent material: Residuum weathered from schist

Typical vegetation: The overstory is dominated by redwood (*Sequoia sempervirens*) and Douglas-fir (*Pseudotsuga menziesii*) with small amounts of western hemlock (*Tsuga heterophylla*). Tanoak (*Lithocarpus densiflorus*) is present in the subcanopy in places. The understory is dominated by California huckleberry (*Vaccinium ovatum*) and Pacific rhododendron (*Rhododendron macrophyllum*). Tanoak and salal (*Gaultheria shallon*) are present in a few places. The forb layer is sparse and may consist of western swordfern (*Polystichum munitum*).

Surface area covered by coarse fragments: 0 to 5 percent coarse, subangular pebbles

Restrictive feature: None noted

Slowest permeability class: Moderately slow

Available water capacity to a depth of 60 inches: About 9.8 inches (high)

Hydrologic properties

Present annual flooding: None

Present annual ponding: None

Surface water runoff class: Medium
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: C

Interpretive groups

Land capability classification, nonirrigated: 2e-5

Rhododendron macrophyllum

Tectah and similar soils

Composition: About 5 percent

Slope: 15 to 30 percent

Landform: Gently concave slopes; broad hollows on ridges

Ecological site: None assigned

561—Trailhead, dry, 15 to 30 percent slopes

Map Unit Setting

General location: East side of Bridge Creek

Major land resource area: 4B—Coastal Redwood Belt

Landscape: Mountains

Landform: Dry, upper mountain slopes. The slope is mostly smooth or gently rolling but is benchy and irregular in places.

Elevation: 1,345 to 2,640 feet (411 to 805 meters)

Mean annual precipitation: 85 to 100 inches (2,160 to 2,550 millimeters)

Mean annual air temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free period: 240 to 270 days

Map Unit Composition

Trailhead—75 percent

Minor components—25 percent

Characteristics of Trailhead and Similar Soils

Slope: 15 to 30 percent

Aspect: North clockwise to southeast

Landform: Broad, undulating ridges

Parent material: Residuum weathered from schist

Typical vegetation: The overstory is dominated by Douglas-fir (*Pseudotsuga menziesii*) with tanoak (*Lithocarpus densiflorus*) in the subcanopy. Redwood (*Sequoia sempervirens*) is a minor associate of the overstory. The understory is dominated by California huckleberry (*Vaccinium ovatum*) with small amounts of Pacific

Soil Survey of Redwood National and State Parks

rhododendron (*Rhododendron macrophyllum*) and salal (*Gaultheria shallon*).

Grasses and forbs are either limited in extent or not present.

Surface area covered by coarse fragments: 0 to 5 percent coarse, subangular pebbles

Restrictive feature: None noted

Slowest permeability class: Moderately slow

Available water capacity to a depth of 60 inches: About 9.3 inches (high)

Note: The Trailhead soil in this map unit has an ustic moisture regime. Other Trailhead soils in the survey area have a udic moisture regime. This difference, however, does not effect use and management.

Hydrologic properties

Present annual flooding: None

Present annual ponding: None

Surface water runoff class: Very high

Current water table: None noted

Natural drainage class: Well drained

Hydrologic soil group: D

Interpretive groups

Land capability classification, nonirrigated: 6e

Ecological site: F004BX109CA, *Pseudotsuga menziesii*–*Sequoia sempervirens*/

Lithocarpus densiflorus–*Vaccinium ovatum*

Typical profile

A—0 to 9 inches (0 to 22 centimeters); loam

Bt1—9 to 25 inches (22 to 63 centimeters); clay

Bt2—25 to 62 inches (63 to 158 centimeters); gravelly clay

BCt—62 to 79 inches (158 to 200 centimeters); extremely cobbly clay

Minor Components

Orthents and similar soils

Composition: About 5 percent

Slope: 50 to 90 percent

Landform: Hillslope hollows; steep mountain slopes

Ecological site: None assigned

Scaath and similar soils

Composition: About 5 percent

Slope: 30 to 75 percent

Landform: Convex slopes; ridge spurs; near tributary headwaters on ridges

Ecological site: F004BX109CA, *Pseudotsuga menziesii*–*Sequoia sempervirens*/
Lithocarpus densiflorus–*Vaccinium ovatum*

Rock outcrop

Composition: About 3 percent

Slope: 30 to 90 percent

Landform: Very steep, strongly convex mountain slopes

Ecological site: None assigned

Rodgerpeak and similar soils

Composition: About 2 percent

Slope: 0 to 15 percent

Landform: Gently convex to planar areas on crest of ridges

Ecological site: F004BX109CA, *Pseudotsuga menziesii*–*Sequoia sempervirens*/
Lithocarpus densiflorus–*Vaccinium ovatum*

587—Childshill, 5 to 30 percent slopes

Map Unit Setting

General location: Mill and Rock Creek watersheds

Major land resource area: 4B—Coastal Redwood Belt

Landscape: Mountains

Landform: Nearly level to moderately steep, broad ridges

Elevation: 1,785 to 2,350 feet (545 to 717 meters)

Mean annual precipitation: 80 to 100 inches (2,030 to 2,550 millimeters)

Mean annual air temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free period: 240 to 280 days

Map Unit Composition

Childshill—65 percent

Minor components—35 percent

Characteristics of Childshill and Similar Soils

Slope: 5 to 30 percent

Aspect: West clockwise to east

Landform: Moderately broad ridges

Parent material: Colluvium and residuum from weakly consolidated fluvial deposits

Typical vegetation: The overstory is dominated by Douglas-fir (*Pseudotsuga menziesii*) with giant chinquapin (*Chrysolepis chrysophylla*) and tanoak (*Lithocarpus densiflorus*) in the subcanopy. The understory is dominated by California huckleberry (*Vaccinium ovatum*) and Pacific rhododendron (*Rhododendron macrophyllum*). Understory cover includes common beargrass (*Xerophyllum tenax*) and western brackenfern (*Pteridium aquilinum*).

Soil Survey of Redwood National and State Parks

Surface area covered by coarse fragments: None

Restrictive feature: None noted

Slowest permeability class: Moderately slow

Available water capacity to a depth of 60 inches: About 7.3 inches (moderate)

Hydrologic properties

Present annual flooding: None

Present annual ponding: None

Surface water runoff class: Medium

Current water table: None noted

Natural drainage class: Well drained

Hydrologic soil group: C

Interpretive groups

Land capability classification, nonirrigated: 4e-1

Ecological site: F004BX113CA, *Pseudotsuga menziesii*–*Chrysolepis chrysophylla*/
Vaccinium ovatum

Typical profile

A1—0 to 3 inches (0 to 8 centimeters); loam

A2—3 to 9 inches (8 to 22 centimeters); sandy clay loam

Bt1—9 to 35 inches (22 to 90 centimeters); gravelly clay loam

Bt2—35 to 65 inches (90 to 165 centimeters); very cobbly clay loam

Minor Components

Surpur and similar soils

Composition: About 10 percent

Slope: 5 to 30 percent

Landform: Saddles and shoulders of ridges

Ecological site: F004BX113CA, *Pseudotsuga menziesii*–*Chrysolepis chrysophylla*/
Vaccinium ovatum

Ustic Palehumults and similar soils

Composition: About 10 percent

Slope: 0 to 30 percent

Landform: Convex areas on broad, undulating ridges

Ecological site: F004BX113CA, *Pseudotsuga menziesii*–*Chrysolepis chrysophylla*/
Vaccinium ovatum

Scaath and similar soils

Composition: About 5 percent

Slope: 0 to 50 percent

Landform: Strongly convex slopes; ridge spurs; near margins of ridges

Ecological site: F004BX109CA, *Pseudotsuga menziesii*–*Sequoia sempervirens*/
Lithocarpus densiflorus–*Vaccinium ovatum*

Ustic Palehumults and similar soils

Composition: About 5 percent

Slope: 0 to 30 percent

Landform: Moderately broad, undulating ridges

Ecological site: F004BX113CA, *Pseudotsuga menziesii*–*Chrysolepis chrysophylla*/
Vaccinium ovatum

Wiregrass and similar soils

Composition: About 5 percent

Slope: 0 to 50 percent

Landform: Gently concave slopes; broad hollows on margins of ridges

590—Sasquatch-Yeti-Footstep complex, 5 to 30 percent slopes

Map Unit Setting

General location: Near the coast and along Highway 101

Major land resource area: 4B—Coastal Redwood Belt

Landscape: Mountains

Landform: Nearly level to moderately steep, broad ridges

Elevation: 180 to 1,295 feet (56 to 395 meters)

Mean annual precipitation: 65 to 90 inches (1,650 to 2,290 millimeters)

Mean annual air temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free period: 250 to 300 days

Map Unit Composition

Sasquatch—45 percent
Yeti—20 percent
Footstep—15 percent
Minor components—20 percent

Characteristics of Sasquatch and Similar Soils

Slope: 5 to 30 percent
Aspect: South clockwise to northeast
Landform: Broad ridges
Parent material: Colluvium and residuum derived from sandstone and mudstone
Typical vegetation: The overstory is dominated by redwood (*Sequoia sempervirens*) with small amounts of Douglas-fir (*Pseudotsuga menziesii*), western hemlock (*Tsuga heterophylla*), and red alder (*Alnus rubra*). Douglas-fir is not present on all sites, and Sitka spruce (*Picea sitchensis*) is the more common species in many places near the coast. The understory is dominated by western swordfern (*Polystichum munitum*) with some patches of California huckleberry (*Vaccinium ovatum*) or salmonberry (*Rubus spectabilis*) and salal (*Gaultheria shallon*).
Surface area covered by coarse fragments: None
Restrictive feature: None noted
Slowest permeability class: Slow
Available water capacity to a depth of 60 inches: About 10.9 inches (very high)

Hydrologic properties

Present annual flooding: None
Present annual ponding: None
Surface water runoff class: Medium
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: C

Interpretive groups

Land capability classification, nonirrigated: 4e-1
Ecological site: F004BX108CA, *Sequoia sempervirens/Polystichum munitum*

Typical profile

Oi—0 to 2 inches (0 to 4 centimeters); slightly decomposed plant material
A—2 to 19 inches (4 to 49 centimeters); loam
Bt1—19 to 65 inches (49 to 165 centimeters); clay loam
Bt2—65 to 79 inches (165 to 200 centimeters); paragravelly clay loam

Characteristics of Yeti and Similar Soils

Slope: 5 to 30 percent
Aspect: South clockwise to northeast
Landform: Broad ridges; upper mountain slopes
Parent material: Colluvium and residuum derived from sandstone and mudstone
Typical vegetation: The overstory is dominated by redwood (*Sequoia sempervirens*) with small amounts of Douglas-fir (*Pseudotsuga menziesii*), western hemlock (*Tsuga heterophylla*), and red alder (*Alnus rubra*). Douglas-fir is not present on all sites, and Sitka spruce (*Picea sitchensis*) is the more common species in many places near the coast. Available water capacity to a depth of 60 inches: About 8.8 inches (high)

Hydrologic properties

Present annual flooding: None
Present annual ponding: None
Surface water runoff class: High
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: C

Interpretive groups

Land capability classification, nonirrigated: 6e
Ecological site: F004BX110CA, *Picea sitchensis*-*Alnus rubra*/*Rubus spectabilis*-*Polystichum munitum*

Typical profile

Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed plant material
A—1 to 9 inches (3 to 24 centimeters); gravelly loam
BA_t—9 to 24 inches (24 to 61 centimeters); gravelly clay loam
B_t—24 to 51 inches (61 to 130 centimeters); gravelly clay loam
BC_t—51 to 76 inches (130 to 193 centimeters); very gravelly loam

Characteristics of Stonehill and Similar Soils

Slope: 30 to 50 percent
Aspect: Southwest clockwise to northwest
Landform: Steeper, more strongly convex mountain slopes
Parent material: Residuum and colluvium derived from schist
Typical vegetation: The overstory is dominated by Sitka spruce (*Picea sitchensis*) and red alder (*Alnus rubra*) with redwood (*Sequoia sempervirens*) as a rare associate. Sitka spruce and red alder occur in a mosaic pattern due to disturbances. Douglas-fir (*Pseudotsuga menziesii*) is codominant on a few sites, but not commonly. The understory is dominated by salmonberry (*Rubus spectabilis*) and western swordfern (*Polystichum munitum*). On some sites, salal (*Gaultheria shallon*) coexists with the salmonberry.
Surface area covered by coarse fragments: None
Depth to restrictive feature: 20 to 40 inches to lithic bedrock

Soil Survey of Redwood National and State Parks

Slowest permeability class: Moderately slow above the bedrock
Available water capacity to a depth of 60 inches: About 5.5 inches (moderate)

Hydrologic properties

Present annual flooding: None
Present annual ponding: None
Surface water runoff class: High
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: C

Interpretive groups

Land capability classification, nonirrigated: 6e
Ecological site: F004BX110CA, *Picea sitchensis-Alnus rubra/Rubus spectabilis*–
Polystichum munitum

Typical profile

Oi—0 to 1 inch (0 to 2 centimeters); slightly decomposed plant material
A—1 to 11 inches (2 to 27 centimeters); cobbly silt loam
Bt—11 to 32 inches (27 to 82 centimeters); gravelly silty clay loam
R—32 to 60 inches (82 to 152 centimeters); bedrock

Minor Components

Devils Creek and similar soils

Composition: About 10 percent
Slope: 30 to 50 percent
Landform: Near seeps and in low, wet places near intermittent streams on mountain slopes
Ecological site: F004BX110CA, *Picea sitchensis-Alnus rubra/Rubus spectabilis*–
Polystichum munitum

Panther Creek and similar soils

Composition: About 7 percent
Slope: 30 to 50 percent
Landform: Near seeps and in low, wet places near intermittent streams on mountain slopes
Ecological site: F004BX110CA, *Picea sitchensis-Alnus rubra/Rubus spectabilis*–
Polystichum munitum

Fluents and similar soils

Composition: About 3 percent
Slope: 0 to 15 percent
Landform: Active channels
Ecological site: None assigned

659—Raingage-Pigpen complex, 15 to 50 percent slopes

Map Unit Setting

General location: Bald Hills area
Major land resource area: 4B—Coastal Redwood Belt
Landscape: Mountains
Landform: Interspersed smooth and hummocky or irregular, middle and lower mountain slopes. The hummocky and irregular areas are earthflows.
Elevation: 215 to 3,185 feet (67 to 971 meters)
Mean annual precipitation: 70 to 90 inches (1,780 to 2,290 millimeters)

Soil Survey of Redwood National and State Parks

Mean annual air temperature: 50 to 59 degrees F (10 to 15 degrees C)

Frost-free period: 250 to 280 days

Map Unit Composition

Raingage—65 percent

Pigpen—20 percent

Minor components—15 percent

Characteristics of Raingage and Similar Soils

Slope: 15 to 50 percent

Aspect: Southeast clockwise to west

Landform: Earthflows; lower mountain slopes

Parent material: Earthflow deposits derived from mudstone and sandstone

Typical vegetation: The existing plant community is dominated by herbaceous species, such as bristly dogstail grass (*Cynosurus echinatus*), orchardgrass (*Dactylis glomerata*), annual vernalgrass (*Anthroxanthum aristatum*), and hairy cat's ear (*Hypochaeris radicata*). Shrubs species, such as Scotch broom (*Cytisus scoparius*) and coyotebrush (*Baccharis pilularis*), are also present on some sites.

Surface area covered by coarse fragments: 3 to 10 percent coarse, subangular pebbles

Restrictive feature: None noted

Slowest permeability class: Moderately slow

Available water capacity to a depth of 60 inches: About 9.3 inches (high)

Hydrologic properties

Present annual flooding: None

Present annual ponding: None

Surface water runoff class: High

Current water table: Present

Natural drainage class: Moderately well drained

Hydrologic soil group: C

Interpretive groups

Land capability classification, nonirrigated: 6e

Ecological site: R004BX103CA, Lower prairie, earthflows, sandstone and mudstone, gravelly loam

Typical profile

A—0 to 17 inches (0 to 44 centimeters); loam

BA—17 to 26 inches (44 to 65 centimeters); very gravelly clay loam

Btg—26 to 51 inches (65 to 130 centimeters); gravelly silty clay loam

Cg—51 to 59 inches (130 to 150 centimeters); gravelly silty clay loam

Characteristics of Pigpen and Similar Soils

Slope: 15 to 50 percent

Aspect: Southeast clockwise to west

Landform: On the steeper, more hummocky or irregular portions of earthflow

Parent material: Earthflow deposits derived from mudstone and sandstone

Typical vegetation: The existing plant community is dominated by herbaceous species, such as bristly dogstail grass (*Cynosurus echinatus*), orchardgrass (*Dactylis glomerata*), annual vernalgrass (*Anthroxanthum aristatum*), and hairy cat's ear (*Hypochaeris radicata*). Shrubs species, such as Scotch broom (*Cytisus scoparius*) and coyotebrush (*Baccharis pilularis*), are also present on some sites.

Surface area covered by coarse fragments: 15 to 30 percent coarse, subangular pebbles

Restrictive feature: None noted

Slowest permeability class: Moderately slow
Available water capacity to a depth of 60 inches: About 6.5 inches (moderate)

Hydrologic properties

Present annual flooding: None
Present annual ponding: None
Surface water runoff class: Very high
Current water table: Present
Natural drainage class: Somewhat poorly drained
Hydrologic soil group: C/D

Interpretive groups

Land capability classification, nonirrigated: 6e
Ecological site: R004BX103CA, Lower prairie, earthflows, sandstone and mudstone, gravelly loam

Typical profile

A—0 to 6 inches (0 to 15 centimeters); gravelly loam
AB—6 to 14 inches (15 to 36 centimeters); gravelly silty clay loam
Bt—14 to 32 inches (36 to 81 centimeters); very cobbly silty clay loam
Cg—32 to 59 inches (81 to 150 centimeters); very gravelly clay loam

Minor Components

Airstrip and similar soils

Composition: About 5 percent
Slope: 15 to 50 percent
Landform: Spur ridges on mountain slopes
Ecological site: R004BX101CA, Upper prairie, mountain slopes, sandstone and mudstone, clay loam

Humic Dystrocherepts and similar soils

Composition: About 5 percent
Slope: 15 to 50 percent
Landform: Irregular slopes that have more rapid earthflow activity; on mountain slopes
Ecological site: R004BX101CA, Upper prairie, mountain slopes, sandstone and mudstone, clay loam

Rock outcrop

Composition: About 5 percent
Slope: 30 to 50 percent
Landform: Very steep, strongly convex earthflows
Ecological site: None assigned

756—Oragan-Weitchpec complex, 30 to 50 percent slopes

Map Unit Setting

General location: Little Bald Hills southeast of the town of Hiouchi
Major land resource area: 5—Siskiyou-Trinity Area
Landscape: Mountains
Landform: Steep mountain slopes
Elevation: 845 to 2,135 feet (259 to 652 meters)
Mean annual precipitation: 90 to 120 inches (2,290 to 3,050 millimeters)
Mean annual air temperature: 50 to 55 degrees F (10 to 13 degrees C)
Frost-free period: 100 to 150 days

Map Unit Composition

Oragan—40 percent
Weitchpec—25 percent
Minor components—35 percent

Characteristics of Oragan and Similar Soils

Slope: 30 to 50 percent
Aspect: Southwest clockwise to northwest
Landform: Mountain slopes
Parent material: Residuum weathered from serpentized peridotite
Typical vegetation: The overstory is dominated by Jeffrey pine (*Pinus jeffreyi*).
The understory is dominated by shrubs, including huckleberry oak (*Quercus vacciniifolia*) and pinemat manzanita (*Arctostaphylos nevadensis*). The forb layer is dominated by Idaho fescue (*Festuca idahoensis*) and California fescue (*Festuca californica*).
Surface area covered by coarse fragments: None
Depth to restrictive feature: 10 to 20 inches to lithic bedrock
Slowest permeability class: Moderately slow above the bedrock
Available water capacity to a depth of 60 inches: About 2.3 inches (very low)

Hydrologic properties

Present annual flooding: None
Present annual ponding: None
Surface water runoff class: High
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: D

Interpretive groups

Land capability classification, nonirrigated: 6e
Ecological site: F005XB104CA, *Pinus jeffreyi/Quercus vacciniifolia*

Typical profile

Oi—0 to 1 inch (0 to 2 centimeters); slightly decomposed plant material
A—1 to 3 inches (2 to 8 centimeters); very stony loam
Bw—3 to 13 inches (8 to 33 centimeters); stony silt loam
R—13 to 17 inches (33 to 43 centimeters); bedrock

Characteristics of Weitchpec and Similar Soils

Slope: 30 to 50 percent
Aspect: Southwest clockwise to northwest
Landform: Mountain slopes
Parent material: Residuum weathered from serpentinite
Typical vegetation: The overstory is dominated by Jeffrey pine (*Pinus jeffreyi*).
The understory is dominated by shrubs, including huckleberry oak (*Quercus vacciniifolia*) and pinemat manzanita (*Arctostaphylos nevadensis*). The forb layer is dominated by Idaho fescue (*Festuca idahoensis*) and California fescue (*Festuca californica*).
Surface area covered by coarse fragments: None
Depth to restrictive feature: 20 to 40 inches to lithic bedrock
Slowest permeability class: Moderately slow above the bedrock
Available water capacity to a depth of 60 inches: About 3.2 inches (low)

Hydrologic properties

Present annual flooding: None
Present annual ponding: None

Surface water runoff class: High
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: B

Interpretive groups

Land capability classification, nonirrigated: 6e
Ecological site: F005XB104CA, *Pinus jeffreyi/Quercus vaccinifolia*

Typical profile

A—0 to 8 inches (0 to 20 centimeters); gravelly silt loam
Bw1—8 to 30 inches (20 to 76 centimeters); extremely gravelly sandy loam
Bw2—30 to 35 inches (76 to 89 centimeters); very gravelly sandy loam
R—35 to 39 inches (89 to 99 centimeters); bedrock

Minor Components

Lithic Haploxeralfs, ultramafic, and similar soils

Composition: About 10 percent
Slope: 50 to 70 percent
Landform: Mountain slopes
Ecological site: F005XB105CA, *Pseudotsuga menziesii–Lithocarpus densiflorus/Quercus vaccinifolia*

Oragan, moderately deep, and similar soils

Composition: About 10 percent
Slope: 30 to 50 percent
Landform: Mountain slopes
Ecological site: F005XB105CA, *Pseudotsuga menziesii–Lithocarpus densiflorus/Quercus vaccinifolia*

Walnett and similar soils

Composition: About 10 percent
Slope: 30 to 50 percent
Landform: Mountain slopes
Ecological site: F005XB105CA, *Pseudotsuga menziesii–Lithocarpus densiflorus/Quercus vaccinifolia*

Rock outcrop

Composition: About 5 percent
Slope: 30 to 75 percent
Landform: Mountain slopes
Ecological site: None assigned

759—Jayel-Walnett-Oragan complex, 30 to 75 percent slopes, extremely stony

Map Unit Setting

General location: Little Bald Hills southeast of the town of Hiouchi
Major land resource area: 5—Siskiyou-Trinity Area
Landscape: Mountains
Landform: Very steep mountain slopes and broad ridges
Elevation: 180 to 3,010 feet (55 to 918 meters)
Mean annual precipitation: 90 to 120 inches (2,290 to 3,050 millimeters)
Mean annual air temperature: 50 to 55 degrees F (10 to 13 degrees C)
Frost-free period: 100 to 180 days

Map Unit Composition

Jayel, extremely stony—35 percent
Walnett, extremely stony—20 percent
Oragan—20 percent
Minor components—25 percent

Characteristics of Jayel and Similar Soils

Slope: 30 to 50 percent
Aspect: Southeast clockwise to north
Landform: Mountain slopes; broad ridges
Parent material: Colluvium and residuum weathered from serpentinized peridotite
Typical vegetation: The overstory is dominated by Jeffrey pine (*Pinus jeffreyi*). The understory is dominated by shrubs, including huckleberry oak (*Quercus vacciniifolia*) and pinemat manzanita (*Arctostaphylos nevadensis*). The forb layer is dominated by Idaho fescue (*Festuca idahoensis*) and California fescue (*Festuca californica*).
Surface area covered by coarse fragments: 3 to 15 percent subangular stones
Depth to restrictive feature: 20 to 39 inches to lithic bedrock
Slowest permeability class: Slow above the bedrock
Available water capacity to a depth of 60 inches: About 3.5 inches (low)

Hydrologic properties

Present annual flooding: None
Present annual ponding: None
Surface water runoff class: Very high
Current water table: None noted
Natural drainage class: Well drained
Hydrologic soil group: D

Interpretive groups

Land capability classification, nonirrigated: 7e
Ecological site: F005XB104CA, *Pinus jeffreyi/Quercus vacciniifolia*

Typical profile

Oi—0 to 1 inch (0 to 2 centimeters); slightly decomposed plant material
A—1 to 11 inches (2 to 28 centimeters); stony clay loam
Bw—11 to 32 inches (28 to 81 centimeters); stony clay
R—32 to 39 inches (81 to 100 centimeters); bedrock

Characteristics of Walnett and Similar Soils

Slope: 30 to 75 percent
Aspect: Southeast clockwise to north
Landform: Mountain slopes
Parent material: Colluvium and residuum weathered from serpentinized peridotite
Typical vegetation: The overstory is dominated by Jeffrey pine (*Pinus jeffreyi*). Hydrologic properties

Present annual ponding: None

Surface water runoff class: Very high

Current water table: None noted

Natural drainage class: Well drained

Hydrologic soil group: D

Interpretive groups

Land capability classification, nonirrigated: 6e

Ecological site: F005XB105CA, *Pseudotsuga menziesii*–*Lithocarpus densiflorus*/
Quercus vaccinifolia

Typical profile

- A—0 to 12 inches (0 to 30 centimeters); clay loam
- Bw—12 to 39 inches (30 to 100 centimeters); clay
- R—39 to 60 inches (100 to 152 centimeters); bedrock

Minor Components

Lithic Haploxeralfs and similar soils

Composition: About 10 percent
Slope: 50 to 70 percent
Landform: Mountain slopes
Ecological site: F005XB105CA, *Pseudotsuga menziesii*–*Lithocarpus densiflorus*/
Quercus vaccinifolia

Oragan, moderately deep, and similar soils

Composition: About 10 percent
Slope: 30 to 50 percent
Landform: Mountain slopes
Ecological site: F005XB105CA, *Pseudotsuga menziesii*–*Lithocarpus densiflorus*/
Quercus vaccinifolia

Ultic Haploxeralfs and similar soils

Composition: About 5 percent
Slope: 30 to 75 percent
Landform: Mountain slopes
Ecological site: F005XB105CA, *Pseudotsuga menziesii*–*Lithocarpus densiflorus*/
Quercus vaccinifolia

W—Water

This unit consists of perennial water bodies, including natural and constructed streams, rivers, lakes, ponds, and estuaries that in most years are covered with water at least during the period warm enough for plants to grow. Many areas are covered with water throughout the year. Pits, blowouts, playas, and reservoirs that contain water are also mapped as water. Areas of this unit were selected from the aerial imagery used during compilation of maps. Water bodies that are too small or too narrow were not mapped.

Use and Management of the Soils

This soil survey is an inventory and evaluation of the soils in the survey area. It can be used to adjust land uses to the limitations and potentials of natural resources and the environment. Also, it can help to prevent soil-related failures in land uses.

In preparing a soil survey, soil scientists, conservationists, engineers, and others collect extensive field data about the nature and behavioral characteristics of the soils. They collect data on erosion, droughtiness, flooding, and other factors that affect various soil uses and management. Field experience and collected data on soil properties and performance are used as a basis in predicting soil behavior.

Information in this section can be used to plan the use and management of soils for crops and pasture; as rangeland and forestland; as sites for buildings, sanitary facilities, highways and other transportation systems, and parks and other recreational facilities; and as wildlife habitat. It can be used to identify the potentials and limitations of each soil for specific land uses and to help prevent construction failures caused by unfavorable soil properties.

Planners and others using soil survey information can evaluate the effect of specific land uses on productivity and on the environment in all or part of the survey area. The survey can help planners to maintain or create a land use pattern in harmony with the natural soil.

Contractors can use this survey to locate sources of sand and gravel, roadfill, and topsoil. They can use it to identify areas where bedrock, wetness, or very firm soil layers can cause difficulty in excavation.

Health officials, highway officials, engineers, and others may also find this survey useful. The survey can help them plan the safe disposal of wastes and locate sites for pavements, sidewalks, campgrounds, playgrounds, lawns, and trees and shrubs.

Interpretive Ratings

The interpretive tables in this survey rate the soils in the survey area for various uses. Many of the tables identify the limitations that affect specified uses and indicate the severity of those limitations. The ratings in these tables are both descriptive and numerical.

Rating Class Terms

Rating classes are expressed in the tables in terms that indicate whether or not the soils are limited by soil features that affect a specified use or in terms that indicate the suitability or potential of the soils for the use. Thus, the tables may show limitation classes, suitability classes, or classes indicating the potential of the soils for the use.

Numerical Ratings

Numerical ratings in the tables indicate the relative severity of individual limitations. The ratings are shown as decimal fractions ranging from 0.00 to 1.00. They indicate gradations between the point at which a soil feature has the greatest negative impact on the use and the point at which the soil feature is not a limitation. The limitations

appear in order from the most limiting to the least limiting. Thus, if more than one limitation is identified, the most severe limitation is listed first and the least severe is listed last.

For additional component horizon data, see the “Soil Properties” section of this publication. Also, a description of typical soils, including a range in characteristics, is included in the “Classification of the Soils” section.

Land Capability Classification

Land capability classification shows, in a general way, the suitability of soils for most kinds of field crops. Crops that require special management are excluded. The soils are grouped according to their limitations for field crops, the risk of damage if they are used for crops, and the way they respond to management. The criteria used in grouping the soils do not include major and generally expensive landforming that would change slope, depth, or other characteristics of the soils, nor do they include possible but unlikely major reclamation projects. Capability classification is not a substitute for interpretations designed to show suitability and limitations of groups of soils for rangeland, for forestland, or for engineering purposes (USDA–SCS, 1961).

In the capability system, soils are generally grouped at three levels—capability class, subclass, and unit.

Capability classes, the broadest groups, are designated by the numbers 1 through 8. The numbers indicate progressively greater limitations and narrower choices for practical use. The classes are defined as follows:

Class 1 soils have slight limitations that restrict their use.

Class 2 soils have moderate limitations that restrict the choice of plants or that require moderate conservation practices.

Class 3 soils have severe limitations that restrict the choice of plants or that require special conservation practices, or both.

Class 4 soils have very severe limitations that restrict the choice of plants or that require very careful management, or both.

Class 5 soils are subject to little or no erosion but have other limitations, impractical to remove, that restrict their use mainly to pasture, rangeland, forestland, or wildlife habitat.

Class 6 soils have severe limitations that make them generally unsuitable for cultivation and that restrict their use mainly to pasture, rangeland, forestland, or wildlife habitat.

Class 7 soils have very severe limitations that make them unsuitable for cultivation and that restrict their use mainly to grazing, forestland, or wildlife habitat.

Class 8 soils and miscellaneous areas have limitations that preclude commercial plant production and that restrict their use to recreational purposes, wildlife habitat, watershed, or esthetic purposes.

Capability subclasses are soil groups within one class. They are designated by adding a small letter, *e*, *w*, *s*, or *c*, to the class numeral, for example, 2*e*. The letter *e* shows that the main hazard is the risk of erosion unless close-growing plant cover is maintained; *w* shows that water in or on the soil interferes with plant growth or cultivation (in some soils the wetness can be partly corrected by artificial drainage); *s* shows that the soil is limited mainly because it is shallow, droughty, or stony; and *c*, used in only some parts of the United States, shows that the chief limitation is climate that is very cold or very dry.

In class 1 there are no subclasses because the soils of this class have few limitations. Class 5 contains only the subclasses indicated by *w*, *s*, or *c* because the soils in class 5 are subject to little or no erosion. They have other limitations that restrict their use to pasture, rangeland, forestland, wildlife habitat, or recreation.

Capability units are soil groups within a subclass. The soils in a capability unit are enough alike to be suited to the same crops and pasture plants, to require

similar management, and to have similar productivity. Capability units are generally designated by adding an Arabic numeral to the subclass symbol, for example, 2e-4 and 3e-6. These units are not given for all capability classes.

The capability classification for each major component is given in table 4 and in the section "Detailed Soil Map Units."

Prime Farmland

Prime farmland is one of several kinds of important farmland defined by the U.S. Department of Agriculture. It is of major importance in meeting the Nation's short- and long-range needs for food and fiber. Because the supply of high-quality farmland is limited, the U.S. Department of Agriculture recognizes that responsible levels of government, as well as individuals, should encourage and facilitate the wise use of our Nation's prime farmland.

Prime farmland, as defined by the U.S. Department of Agriculture, is land that has the best combination of physical and chemical characteristics for producing food, feed, forage, fiber, and oilseed crops and is available for these uses. It could be cultivated land, pastureland, forestland, or other land, but it is not urban or built-up land or water areas. The soil qualities, growing season, and moisture supply are those needed for the soil to economically produce sustained high yields of crops when proper management, including water management, and acceptable farming methods are applied. In general, prime farmland has an adequate and dependable supply of moisture from precipitation or irrigation, a favorable temperature and growing season, acceptable acidity or alkalinity, an acceptable salt and sodium content, and few or no rocks. It is permeable to water and air. It is not excessively erodible or saturated with water for long periods, and it either is not frequently flooded during the growing season or is protected from flooding. Slope ranges mainly from 0 to 6 percent. More detailed information about the criteria for prime farmland is available at the local office of the Natural Resources Conservation Service.

About 369 acres, or only about 0.2 percent of the survey area, meets the requirements for prime farmland.

A recent trend in land use in some parts of the survey area has been the loss of some prime farmland to industrial and urban uses. The loss of prime farmland to other uses puts pressure on marginal lands, which generally are more erodible, droughty, and less productive and cannot be easily cultivated.

The map units in the survey area that are considered prime farmland are listed in table 5. This list does not constitute a recommendation for a particular land use. On some soils included in the list, measures that overcome a hazard or limitation, such as flooding, wetness, and droughtiness, are needed. Onsite evaluation is needed to determine whether or not the hazard or limitation has been overcome by corrective measures. The extent of each listed map unit is shown in table 3. The location is shown on the detailed soil maps. The soil qualities that affect use and management are described under the heading "Detailed Soil Map Units."

Major Land Resource Areas

A major land resource area (MLRA) is a broad geographic area that has a distinct combination of climate, topography, elevation, potential natural vegetation, soils, hydrology, land use, and general type of farming (USDA–SCS, 1981). The two MLRAs in the survey area are 4B–Coastal Redwood Belt and 5–Siskiyou-Trinity Area. The major land resource area for each map unit is listed in the detailed soil map unit descriptions.

MLRA 4B, Coastal Redwood Belt.—More than 95 percent of the survey area is in MLRA 4B. In this major land resource area, the climate is tempered by cool marine air throughout the year. Winters are mild and wet, and summers are dry with frequent

coastal fog. The landscape is dominated by strongly sloping to very steep mountains and has nearly level to steep, dissected, uplifted marine terraces along the coast. Sedimentary rocks of the Franciscan complex underlie most areas. Plio-Pleistocene fluvial and marine sediments underlie some areas between Holter Ridge and the Pacific Ocean south of Klamath and on Child's Hill in the Mill Creek watershed. The natural vegetation is mainly redwood, Douglas-fir, and western hemlock with Sitka spruce along the immediate coast. Elevation ranges from sea level to 3,262 feet (944 meters) at an unnamed summit south of Coyote Peak. The average annual precipitation ranges from 60 inches (1,520 millimeters) near Orick to over 100 inches (2,550 millimeters) at the higher elevations and inland areas along the Smith River. The average annual air temperature ranges from 50 to 55 degrees F (10 to 13 degrees C), and the average frost-free season ranges from 250 to 325 days. The soil temperature regime is generally isomesic along the coastal region within the fog belt and mesic in more inland areas. The soil moisture regime is udic near the coast and ustic farther inland.

In the survey area, most of the land in this major land resource area was formerly used for timber production and grazing and is currently used for wildlife, recreation, and watershed.

MLRA 5, Siskiyou-Trinity Area.—Less than 5 percent of the survey area is in MLRA 5, including the eastern portion of the Bald Hills and the eastern portion of the Lower Park Protection Zone in the Lower Redwood Creek basin and the Little Bald Hills area east of Crescent City. This major land resource area consists of the mountainous terrain outside the strong coastal influence of maritime climate. Winters are cold and wet, and summers are warm and dry. The landscape is dominated by strongly sloping to very steep mountains. Metamorphic rocks of the Western Jurassic Belt of the Klamath terrane dominate in this area. The natural vegetation is mainly Douglas-fir and tanoak. Elevation ranges from 160 to 4,920 feet (50 to 1,500 meters). The average annual precipitation ranges from 70 to 100 inches (1,780 to 2,550 millimeters). The average annual air temperature ranges from 50 to 59 degrees F (10 to 15 degrees C), and the average frost-free season ranges from 100 to 250 days. The soil temperate regime is generally mesic, and the soil moisture regime is typically xeric.

In the survey area, most of the land in this major land resource area was formerly used for timber production and grazing and is currently used for wildlife, recreation, and watershed.

Forestland Productivity and Management

Judy Welles, forester, Natural Resources Conservation Service, helped prepare this section.

The general information provided in this section is intended as a guide. It may help resource managers, landowners, and visitors to understand the characteristics and management of forest soils within the survey area. Onsite investigation by resource professionals is needed for the acquisition of site-specific data. Such investigation may result in better solutions to specific resource problems than the general information in this section and associated tables.

Forestland Productivity

In table 6, the *potential productivity of common trees* is expressed as an average site index and as a volume number. Also listed in the table are the standard deviation for the site index, the base age for the site index, and the age for which the culmination of mean annual increment is calculated. The *site index* is the average height in feet that dominant and codominant trees of a given species attain in a specified number of years. The site index applies to fully stocked, even-aged, unmanaged stands. The

average (mean) site index is listed for each soil for which adequate data is available. Redwood site indexes are based on 100-year curves by Lindquist and Palley (1963) and 50-year curves by Wensel and Krumland (1986). Douglas-fir site indexes are based on 100-year curves by McArdle, Meyer, and Bruce (1961) and 50-year curves by King (1966). Sitka spruce site indexes are based on 100-year curves by Meyer (1937). Western hemlock site indexes are based on 100-year curves by Barnes (1962).

The *volume of wood fiber* is the yield likely to be produced by a given tree species, expressed as cubic feet per acre per year. The volume is calculated at the age of culmination of the mean annual increment (CMAI) for fully stocked, unmanaged, natural stands as given in standard normal yield tables. Values are based on yield tables by McArdle, Meyer, and Bruce (1961) for Douglas-fir, Lindquist and Palley (1963) for redwood, Meyer (1937) for Sitka spruce, and Barnes (1962) for western hemlock. Wind can reduce productivity well below the estimates for soils on exposed ridges or on sites adjacent to the ocean.

Areas supporting large amounts of hardwood, such as tanoak, madrone, red alder, and Oregon white oak, were not measured, and estimates of potential productivity are not available.

Forest trees are those that are preferred for planting, seeding, or natural regeneration and those that remain in the stand after thinning or partial harvesting.

Forestland Management

Tables 7a through 7e can be utilized by resource managers in planning the use of forestland within the survey area. Rating class terms indicate the degree to which the soils are suited to specified management practices. Numerical ratings in the tables indicate the severity of individual limitations. The ratings are shown as decimal fractions ranging from 0.01 to 1.00. They indicate gradations between the point at which a soil feature has the greatest negative impact on the specified forest management practice (1.00) and the point at which the soil feature is not a limitation (0.00). More detailed information about the criteria used in the ratings is available in the "National Forestry Manual," which is available at the local offices of the Natural Resources Conservation Service or online (<http://soils.usda.gov/>).

Table 7a

Table 7a shows suitability for hand planting, mechanical planting, and use of harvesting equipment.

Soil properties and the aspects of the physical environment that affect planting depth affect reforestation options. Erosion, coarse fragments, and steep slopes may contribute to difficulty in planting. Limitations that affect planting are considered in terms of site factors that obstruct planting and reduce planting efficiency. Locally, hand planting is generally more common than mechanical planting due to the slope and rocks. Mechanical planting is generally limited to areas that have a slope of less than 15 percent and that are relatively free of rocks. Rating class terms for suitability for hand planting and mechanical planting are based on slope, depth to a restrictive layer, rock fragments on or below the surface, plasticity index, content of sand, depth to water table, and ponding. The soils are described as well suited, moderately suited, poorly suited, or unsuited to these methods of planting. It is assumed that necessary site preparation is completed before seedlings are planted. Compaction due to harvesting or other site activities is not considered. *Well suited* indicates that few or no restrictions to planting are expected, and planting rates should not be affected; *moderately suited* indicates one or more restrictions exist that impede planting and reduce planting rates; *poorly suited* indicates one or more restrictions that severely impede planting and reduce planting rates; and *unsuited* indicates that site factors and features prevent the proper planting of seedlings.

Soil wetness caused by seasonal precipitation influences the type of harvesting equipment that can be used and the season of use. The soils in the survey area are usually too wet for the use of ground-yarding systems from about November 15 to April 1. Except for the sandy or very gravelly soils, all of the soils are susceptible to compaction by wheeled or tracked equipment when wet. Heavily compacted or puddled soils are generally less productive than other soils.

Slope gradient is another important consideration affecting the selection of harvesting equipment and systems. In areas where slopes are less than 30 percent, few limitations affect the use of wheeled or tracked equipment. In areas where slopes are 30 to 50 percent, extra care is needed in the selection of equipment. Cable-yarding systems generally cause the least soil disturbance where the terrain and road systems are conducive to their use. In large areas where slopes are more than 50 percent, less soil disturbance results from cable- or helicopter-yarding than from tractor yarding.

Table 7b

Table 7b shows suitability for surface mechanical site preparation and deep mechanical site preparation.

Ratings in the table are based on slope, depth to a restrictive layer, plasticity index, rock fragments on or below the surface, depth to a water table, and ponding. Ratings for surface mechanical site preparation are for the part of the soil from the surface to a depth of about 12 inches (30 centimeters). Ratings for deep mechanical site preparation are for the part of the soil from the surface to a depth of 36 inches (90 centimeters).

Ratings of well suited, poorly suited, or unsuited are used to indicate the degree to which the physical properties of a site limit efficiency of mechanical site preparation. Slope gradient and the amount of rock fragments generally limit the potential for mechanical site preparation. Slopes greater than 15 percent are generally poorly suited to mechanical site preparation, and slopes greater than 35 percent are generally unsuited. Equipment use should be limited or avoided on soils that are subject to ponding or that have a water table at a shallow depth.

Compaction and loss of organic matter and nutrients caused by mechanical site preparation can degrade a site. To minimize compaction, mechanical site preparation should be restricted to dry soils. The use of equipment with teeth limits the amount of soil going into brush piles and reduces the loss of organic matter. On previously compacted soils, mechanical site preparation to a depth of greater than 20 inches (50 centimeters) can improve seedling growth (Adams, 1992).

Table 7c

Table 7c indicates the limitations affecting construction of haul roads and log landings, suitability for log landings, and soil rutting hazard.

Ratings in the table are based on slope, flooding, permafrost, plasticity index, hazard of soil slippage, content of sand, Unified classification, rock fragments on or below the surface, depth to a restrictive layer that is indurated, depth to a water table, and ponding. These ratings reflect the aspects of the physical environment that make road construction difficult. Slope gradient, bedrock type, and the soil properties and characteristics that reduce road-building efficiency increase construction costs and the potential for road failure and landslides. The potential for erosion and sedimentation can be minimized by careful planning and placement of roads (Weaver and Hagans, 1994).

Limitations affecting construction of haul roads and log landings are rated as slight, moderate, or severe. The ratings indicate the potential for reduced efficiency in the construction of haul roads and log landings, increased costs due to physical obstructions or soil characteristics, and increased incidence of road failure or landslides. A rating of *slight* indicates few or no limitations to construction activities,

moderate indicates that one or more limitations can cause some difficulty in construction, and *severe* indicates that one or more limitations can make construction very difficult or more costly.

Slope gradient affects the cost and efficiency of constructing haul roads and log landings. Erosion and stability issues also increase as slope gradient increases. Erodibility and road stability are controlled by soil texture and depth to bedrock or a restrictive layer. Road construction in areas of weathered or fractured bedrock typically results in road-building problems and increased construction and maintenance costs. Shallow soils or soils that have a high content of clay or sand can create similar impacts. Geology and topography affect the potential for soil slippage, landslides, and road failure.

Ratings in the column *suitability for log landings* are based on slope, surface rock fragments, plasticity index, content of sand, Unified classification, depth to a water table, ponding, flooding, and the hazard of soil slippage. The soils are described as well suited, moderately suited, or poorly suited. A rating of *well suited* indicates that there are no significant limitations affecting landing suitability, *moderately suited* indicates that there are limitations affecting landing suitability, and *poorly suited* indicates that there are one or more limitations that make landing suitability highly unfavorable. The ratings relate to the efficiency and costs of landing construction and the potential for landing failure or unsafe operation. Slope gradient, bedrock type and location, and soil strength are the main factors that affect suitability of sites for log landings (Weaver and Hagans, 1994).

Soil rutting hazard reflects the erodibility caused by the operation of ground-based forest management equipment. Soil deformation and compaction can occur simultaneously with rutting. Rutting acts to collect runoff and cause additional erosion of roads or trails. Operation of heavy equipment and/or multiple passes of equipment over an area under wet conditions can affect site productivity and groundwater hydrology of the area. Predesignation of skid trails, use of high flotation equipment, or use of alternative logging methods may be needed to minimize compaction. The rating criteria are based on depth to a water table, the amount of rock fragments at or below the surface, Unified classification, depth to a restrictive layer, and slope. Slopes that are greater than 20 percent can adjust ratings to one class more limiting. Ratings are slight, moderate, and severe. A rating of *slight* indicates that the soil is subject to little or no rutting, *moderate* indicates rutting is likely, and *severe* indicates that ruts form readily.

Table 7d

Table 7d indicates the hazard of off-road and off-trail erosion, the hazard of erosion on road and trails, and the suitability of the natural surface for roads.

According to Weaver and Hagans (1994), forest roads and ranch roads have the potential to contribute significantly to runoff and stream sedimentation by increasing the hazard of erosion, the amount of sediment transfer, and the number of landslides. Insufficient inspection and maintenance of roads and drainage structures can also lead to the movement of soil and delivery of sediment to water courses.

Ratings in the column *hazard of off-road or off-trail erosion* are based on slope and soil erodibility factor K. The soil loss is caused by sheet or rill erosion where 50 to 75 percent of the surface has been exposed by logging, grazing, mining, or other kinds of disturbance. The hazard is described as slight, moderate, severe, or very severe. A rating of *slight* indicates that the amount of erosion is small under ordinary climatic conditions; *moderate* indicates that some erosion is likely and that erosion-control measures may be needed during logging or road building; *severe* indicates that erosion is very likely and that erosion-control measures, including revegetation of bare areas, is advised to prevent soil loss; and *very severe* indicates that significant erosion is expected, loss of soil productivity and off-site damage are likely, and erosion-control measures are costly and generally impractical.

Ratings in the column *hazard of erosion on road and trails* are based on soil erodibility factor K, slope, and content of rock fragments. The ratings apply to unsurfaced roads and trails. Some soil textures, such as silt, silt loam, and sandy loam, have higher erodibility factors and in sloping areas can lead to increased erosion, sedimentation, road maintenance, and costs. A rating of *slight* indicates that little or no erosion is likely; *moderate* indicates that some erosion is likely, roads or trails may require occasional maintenance, and simple erosion-control measures are needed; and *severe* indicates that significant erosion is expected, roads or trails require frequent maintenance, and costly erosion-control measures are needed.

Ratings in the column *suitability for roads (natural surface)* are based on slope, surface rock fragments, plasticity index, content of sand, Unified classification, depth to water table, ponding, flooding, and hazard of soil slippage. The ratings indicate the suitability for using the natural surface of the soil for roads. Soils that are not well suited may need enhanced surfacing to improve trafficability and to reduce the hazard of erosion. The soils are described as well suited, moderately suited, or poorly suited to this use. *Well suited* indicates few or no restrictions to natural road suitability, *moderately suited* indicates one or more restrictions reduce site suitability, and *poorly suited* indicates one or more restrictions generally make the natural surface of the soil very difficult or unsafe to use as a site for a road.

Roads may be frequently impassable during the rainy season, except where they are covered with rocks or are on very gravelly or sandy soils. Roads that are used during winter months should be surfaced to improve efficiency, provide for safe operation, and reduce the hazard of erosion. Some soils are dusty when dry and require watering or other road-surface and dust-control treatments during periods of heavy use.

Maintenance of the road surface can significantly reduce the amount of sediment that enters streams from road surfaces (Weaver and Hagans, 1994). Conservation practices that can prevent excessive soil loss and degradation of water quality include properly locating, designing, and installing skid trails, roads, culverts, waterbars, and stream crossings. Seeding and mulching cut-and-fill slopes can reduce the hazard of sheet and rill erosion. Vegetative buffer strips along streams help to prevent sedimentation, control streambank erosion, and maintain favorable water temperature.

Table 7e

Table 7e indicates the potential for damage to soil by fire and the potential for seedling mortality.

Ratings in the column *potential for damage to soil by fire* are based on the texture of the surface layer, the content of rock fragments and organic matter in the surface layer, the thickness of the surface layer, and slope. The ratings can be used as general guidelines when plans are made for prescribed burns or for revegetation after wildfire. The risk of damage to soils by fire increases with the intensity of heat. Physical properties of soils, such as porosity and the content of organic matter, can be significantly altered by hot fires (Daniels, Helms, and Baker, 1979). Some soils have characteristics that enable them to withstand these changes better than other soils. Loss of the duff layer and alteration of soil structure following prescribed burning can lead to a decrease in pore volume and rate of water passage through the soil, thereby resulting in increased runoff and erosion (Minard, 2003).

A rating of *low* indicates that most types of fire will not adversely affect soil characteristics and future productivity, *moderate* indicates that some extra care in planning is needed to maintain favorable soil characteristics, and *high* indicates that special management is needed to protect organic matter and thus maintain productivity. Moderate or high ratings can indicate the need to burn in a specific season, reduce the quantity of fuel, or lengthen the period between burns (Wells and others, 1979).

Ratings in the column *potential for seedling mortality* are based on flooding, ponding, depth to a water table, reaction, available water capacity, soil moisture regime, soil temperature regime, aspect, and slope. Low, moderate, and high ratings indicate the degree to which soil affects the mortality of tree seedlings. Plant competition, which may be a significant factor, is not considered in the ratings. The ratings apply to good stock that is properly planted during a period of sufficient rainfall. A rating of *low* indicates that seedlings are expected to develop normally and become established; *moderate* indicates that root development may be restricted sufficiently to cause death of seedlings, that establishment of surviving seedlings may be delayed, and that extra precautions are advisable; and *high* indicates that seedlings are not expected to survive without special treatment or management and that replanting may be necessary.

The trees selected for planting should be those that are suited to the soils. Natural reforestation by Douglas-fir seed trees and redwood sprouts provides variable stocking results and may not be dependable for attaining the earliest optimum stocking.

A few soils in the survey area have chemical toxicities or imbalances that hinder tree growth. Soils that formed in serpentinitic parent material are known to have ratios of calcium to magnesium that are detrimental to the growth of Douglas-fir and redwood (Zinke and Colwell, 1965). Additionally, serpentinitic soils are commonly derived from rock outcrops on steep ground. This harsh environment can present significant challenges to plant growth and survival (Kruckeberg, 1984).

The soil properties that commonly influence seedling mortality include texture, content of rock fragments, temperature, and drainage. Soils in the udic-isomesic soil climate regime generally have few limitations affecting seedling survival. Exceptions may be found on poorly drained soils or steep and gravelly soils. In the ustic-isomesic soil climate regime, soil and air temperatures are slightly higher and soil moisture is less abundant because of reduced marine influence. These characteristics are especially apparent if the tree canopy is removed. The available water capacity in the upper 2 feet of the soil influences seedling mortality. Soils with an available water capacity of less than 2.5 inches in the upper 2 feet are severely limited for redwood seedlings, especially on south-facing slopes. Partial shading may be desirable, or a different species, such as Douglas-fir, may be planted.

Forest Cover Types

The major forest cover types in the survey area are redwood, Pacific Douglas-fir, Douglas-fir–tanoak–madrone, and Sitka spruce (Eyre, 1980). Cover types of limited extent include red alder, Oregon white oak, Jeffrey pine, canyon live oak, and knobcone pine.

Forest Soil Climate Zones

The plant species and forest ecological sites in the survey area vary with distance from the ocean, elevation, soil, relief, aspect, and history of disturbance. Three major soil climate regimes, as recognized by “Keys to Soil Taxonomy” (Soil Survey Staff, 2003), exist under forest vegetation in the survey area. Soil temperature at a depth of 50 centimeters (20 inches) and duration and season of soil moisture at a depth of 10 to 100 centimeters (4 to 40 inches), depending on the texture and content of rock fragments, are used to establish the soil climate regimes.

The soil climate regimes in the survey area are strongly influenced by the cool, moist marine air from the Pacific Ocean and by the extent and duration of fog. Each soil climate regime and the plant communities that typify these regimes are described in this section. Vegetation studies by Mahoney (1999), Popenoe (1998), and Muldavin and others (1981) were used in the establishment of soil-plant relationships. Soil scientists used key indicator species as an aid in identifying and mapping soil climate regimes.

Udic-Isomesic (general soil map units 1 to 11)

This soil climate regime is directly adjacent to the ocean and extends inland along the Smith and Klamath Rivers and Redwood, Mill, Prairie, Lagoon, and Wilson Creeks. It extends 3 to 10 miles or to the first major north-south ridge. Elevation ranges from sea level to 2,790 feet (850 meters). Heavy fog occurs frequently throughout areas of this climate regime, but the extent and duration lessens significantly at about 2 miles inland.

The soils hold plant-available water during most or all of the year. The upper part of soils on the inland margin of this climate regime may experience drying for 30 to 45 days from late September into early October. Soil temperature at a depth of 50 centimeters (20 inches) varies less than 9 degrees F (6 degrees C) between summer and winter. The canopy is dominated by Redwood, Sitka spruce, and red alder with lesser amounts of western hemlock, Douglas-fir, tanoak, and cascara. Shrubs, in the order of dominance, are evergreen (California) huckleberry, Pacific rhododendron, salmonberry, thimbleberry, and salal. Pacific rhododendron, salmonberry, western hemlock, or a thick cover of western swordfern are key indicators for ecological sites in this climate regime.

Western swordfern and redwood-sorrel dominate the understory forb cover in the moister ecological sites within this climate zone. The drier sites have some western swordfern but are dominated by the shrub species.

Ustic-Isomesic (general soil map unit 12)

This climate regime is on steep mountain slopes and ridges east of Redwood Creek and on the eastern edge of the Mill Creek and Rock Creek watersheds. Elevation ranges from 340 to 3,200 feet (105 to 975 meters). A moderately weak marine influence minimizes seasonal fluctuations in air temperature and thus results in minimal fluctuations in soil temperature. The fog influence is less pronounced than in the udic-isomesic regime, but some fog occurs.

The soils may be dry from July through early October, and soil temperature at a depth of 50 centimeters (20 inches) varies less than 9 degrees F (6 degrees C) between summer and winter. The vegetation is mainly Douglas-fir, tanoak, madrone, California bay, and scattered pockets of redwood with a sparse evergreen shrub layer dominated by California huckleberry and salal. The absence of Pacific rhododendron, salmonberry, and western hemlock are used to identify ecological sites within this climate regime.

Xeric-Mesic (general soil map units 13 to 16)

This soil climate regime is on steep mountain slopes and ridges in the lower Redwood Creek and Lacks Creek watersheds and upper mountain slopes and ridges along the eastern margins of the Mill Creek and Rock Creek watersheds. Elevation ranges from 165 to 4,085 feet (50 to 1,245 meters). This soil climate regime is subject to little or no marine influence.

The soils are dry from late June through October, and soil temperature at a depth of 50 centimeters (20 inches) varies more than 9 degrees F (6 degrees C) between summer and winter. Plant communities are diverse and are determined by soil type, aspect, elevation, and past disturbance. On soils derived from sandstone and mudstone, the main tree species are Douglas-fir, tanoak, madrone, and California bay with a sparse evergreen shrub layer dominated by California huckleberry. On soils derived from serpentinite, peridotite, and serpentinized peridotite along the eastern margins of the Mill Creek and Rock Creek watersheds, the vegetation is mainly Jeffery pine, knobcone pine, Douglas-fir, and tanoak with huckleberry oak, pinemat manzanita, greenleaf manzanita, forbs, and grasses. The absence of Pacific rhododendron, salmonberry, and western hemlock and the presence of a sparse forb layer are used to identify ecological sites within this climate regime.

Forestland Ecological Sites

Forestland, for the purposes of developing ecological site descriptions, is a spatially defined site where the historic climax plant community was dominated by a 25 percent overstory canopy of trees, as determined by a crown perimeter vertical projection. Rangeland, sometimes referred to as “wildland,” has a native vegetation of grasses, grasslike plants, forbs, shrubs, and trees with a total tree canopy cover of less than 25 percent.

Forested landscapes are divided into ecological sites for purposes of inventory, evaluation, and management. Ecological sites that characterize and quantify forestland based on its ability to produce various kinds, amounts, and proportions of vegetation are useful tools for resource managers. The productive capacity of each site, along with its characteristic plant community, is largely dependent on the soils, climate, topography, aspect, slope, and other abiotic features under which it developed. The Natural Resources Conservation Service classifies forestland and rangeland into ecological sites to help in the understanding of the commonly complex soil-plant interactions and effects of natural disturbance and management practices on plant communities. An ecological site is defined as a distinctive kind of land with specific physical characteristics that differs from other kinds of land in its ability to produce a distinctive kind and amount of vegetation.

Twenty-four ecological sites have been developed for the survey area. The correlation between soil types and plant communities served as the basis for the development of each of the ecological site descriptions. Geology and climate play a large role in the location of plant communities across the landscape and are also reflected in soil properties. The survey area has mild, wet winters and cool, moist summers. Average precipitation ranges from 70 to 100 inches per year. Coastal fog is an integral part of the coastal effect and ameliorates the effects of solar radiation and evapotranspiration on vegetation. Condensation from fog is thought to be an additional source of moisture to the redwood (*Sequoia sempervirens*) forest. Transitioning from the coast towards the eastern edge of Redwood National Park and the Lower Park Protection Zone, summer temperatures increase and the fog effect is lessened, altering plant community composition and distribution. Sitka spruce (*Picea sitchensis*) forest forms a fringe along the coast. Farther inland, nearly pure redwood (*Sequoia sempervirens*) forests dominate with some other conifers, including western hemlock (*Tsuga heterophylla*) and Douglas-fir (*Pseudotsuga menziesii*). Still farther inland, Douglas-fir (*Pseudotsuga menziesii*) becomes more prevalent in the overstory, coexisting with redwood (*Sequoia sempervirens*) and tanoak (*Lithocarpus densiflorus*). Far enough inland, the forest finally merges into Douglas-fir–tanoak–madrone forest type or to oak woodland or prairie.

The soil properties that have the greatest influence on the productivity of forest vegetation and the composition and distribution of the plant community are those that affect moisture supply and plant nutrients. Examples include soil texture, depth, and content of rock fragments. Differences in the soil properties that affect the composition, production, and distribution of the plant community are accounted for in the correlation of ecological sites to individual map unit components.

A brief description of each forestland ecological site in the survey area is given in the following paragraphs. A complete description of each can be obtained at the local office of the Natural Resources Conservation Service or from the Web site of the Ecological Site Information System at <http://esis.sc.egov.usda.gov/>.

See the section “Detailed Soil Map Units” for the specific soils that are correlated to each ecological site in the survey area. Ecological sites were not assigned to units with nonnative forest or to units where the trees were not suitable for sampling.

F004BX101CA, *Sequoia sempervirens*–*Pseudotsuga menziesii*/Rhododendron macrophyllum (Redwood–Douglas-fir/Pacific rhododendron, mountain slopes, schist, clay loam).—This ecological site is on mountain slopes west of Redwood Creek. It is

on the uniform to slightly convex summits and shoulders of broad ridges and in gently concave to slightly convex positions on strongly sloping to steep mountain slopes. The soils are well drained and formed in colluvium and residuum weathered from schist.

This site is dominated by an overstory community of redwood (*Sequoia sempervirens*) and Douglas-fir (*Pseudotsuga menziesii*) with tanoak (*Lithocarpus densiflorus*) in the subcanopy. Western hemlock (*Tsuga heterophylla*) grows in a few places. The understory is dominated by shrubs, including Pacific rhododendron (*Rhododendron macrophyllum*), California huckleberry (*Vaccinium ovatum*), and small amounts of salal (*Gaultheria shallon*). The herbaceous cover is limited in extent.

F004BX102CA, *Pseudotsuga menziesii*–*Sequoia sempervirens*/*Lithocarpus densiflorus* (Douglas-fir–redwood/tanoak, mountain slopes, sandstone, clay loam).—This ecological site is on the inland mountain slopes of the lower Redwood Creek and Prairie Creek basins. It is on the shoulders of ridges and in uniform to slightly convex positions on the middle and lower mountain slopes. The mountain slopes are deeply incised and steep or very steep. The soils are well drained, very deep, and formed in colluvium and residuum derived from sandstone and mudstone.

The site is dominated by an overstory community of Douglas-fir (*Pseudotsuga menziesii*) with small amounts of redwood (*Sequoia sempervirens*). Redwood is not on all sites. A moderate amount of tanoak (*Lithocarpus densiflorus*) is in the subcanopy. In a few places, Pacific madrone (*Arbutus menziesii*) is in the subcanopy along with the tanoak. The understory is dominated by shrubs, including the shrub form of tanoak (*Lithocarpus densiflorus*), salal (*Gaultheria shallon*), and California huckleberry (*Vaccinium ovatum*). The herbaceous cover is either very limited in extent or not present.

F004BX103CA, *Sequoia sempervirens*–*Pseudotsuga menziesii*/*Rhododendron macrophyllum* (Redwood–Douglas-fir/Pacific rhododendron, mountain slopes, sandstone, clay loam).—This ecological site is within the watersheds of Mill, Rock, Wilson, and Hunter Creeks and east of Redwood Creek near and southeast of Orick Valley. It is on uniform to slightly convex summits and shoulders of broad ridges and uniform to slightly convex mountain slopes. The mountain slopes are strongly sloping to very steep. The soils are well drained and formed in colluvium and residuum derived from sandstone and mudstone.

A redwood (*Sequoia sempervirens*) overstory dominates the canopy cover. Douglas-fir (*Pseudotsuga menziesii*) and western hemlock (*Tsuga heterophylla*) are present in small amounts. Tanoak (*Lithocarpus densiflorus*) forms the subcanopy. The understory is dominated by Pacific rhododendron (*Rhododendron macrophyllum*), California huckleberry (*Vaccinium ovatum*), and salal (*Gaultheria shallon*). The herbaceous cover is limited in extent.

F004BX104CA, *Sequoia sempervirens*–*Pseudotsuga menziesii*/*Rhododendron macrophyllum* (Redwood–Douglas-fir/Pacific rhododendron, ridgetops, schist, red clay).—This ecological site is on ridgetops and upper mountain slopes west of Redwood Creek and east of Prairie Creek. It is on uniform, nearly level to moderately steep summits and slightly convex shoulders of broad ridges and moderately steep to steep mountain slopes. The soils are well drained and dominantly formed in residuum and colluvium derived dominantly from schist. Some soils of lesser extent developed from residuum and colluvium derived from sandstone and mudstone or weakly consolidated fluvial and marine deposits.

The site is primarily an overstory of redwood (*Sequoia sempervirens*) and Douglas-fir (*Pseudotsuga menziesii*). Western hemlock (*Tsuga heterophylla*) is a minor overstory component on most sites. Redwood and Douglas-fir are represented nearly equally, although redwood is commonly more dominant. Tanoak (*Lithocarpus densiflorus*) is present in the subcanopy in places. California huckleberry (*Vaccinium ovatum*) and Pacific rhododendron (*Rhododendron macrophyllum*) dominate the shrub layer. Tanoak and salal (*Gaultheria shallon*) are present in a few places. The herbaceous cover is sparse and may consist of western swordfern (*Polystichum munitum*).

F004BX105CA, *Pseudotsuga menziesii*–*Lithocarpus densiflorus*/*Vaccinium ovatum* (Douglas-fir–tanoak/California huckleberry, ridgetops, schist, red clay).—This ecological site is on dry, upper mountain slopes and narrow ridgetops west of Redwood Creek and within the Mill Creek and Rock Creek watersheds near the boundary of Six Rivers National Forest. It is on uniform to slightly convex, strongly sloping and moderately steep summits and shoulders and steep mountain slopes. The soils are well drained and formed in colluvium and residuum derived from schist and metasedimentary rocks.

The site is dominated by an overstory of Douglas-fir (*Pseudotsuga menziesii*) with tanoak (*Lithocarpus densiflorus*) in the subcanopy. Redwood (*Sequoia sempervirens*) is a minor associate of the overstory. The understory is dominated by shrubs, including California huckleberry (*Vaccinium ovatum*), with small amounts of Pacific rhododendron (*Rhododendron macrophyllum*) and salal (*Gaultheria shallon*). The herbaceous cover is limited in extent or not present.

F004BX106CA, *Sequoia sempervirens*–*Pseudotsuga menziesii*/*Vaccinium ovatum*/*Polystichum munitum* (Redwood–Douglas-fir/California huckleberry/western swordfern, hills, soft sandstone, very gravelly loam).—This ecological site is north and northeast of Orick in the Prairie Creek watershed. It is on uniform to slightly convex summits, shoulders, and backslopes of hills and steep mountain slopes. The soils are well drained, very deep, and formed in colluvium and residuum derived from weakly consolidated sandstone and conglomerate of the Prairie Creek formation.

The site is dominated by an overstory of redwood (*Sequoia sempervirens*) with moderate amounts of Douglas-fir (*Pseudotsuga menziesii*). Sitka spruce (*Picea sitchensis*) is present in a few places and replaces Douglas-fir on some sites that are in close proximity to the coast. The amount of shrubs and the herbaceous cover are nearly equal. The shrub layer is dominated by California huckleberry (*Vaccinium ovatum*), with small amounts salal (*Gaultheria shallon*) in a few places. Ground cover is dominated by western swordfern (*Polystichum munitum*) and redwood-sorrel (*Oxalis oregana*).

F004BX107CA, *Sequoia sempervirens*/*Polystichum munitum* (Redwood/western swordfern, hills, soft sandstone, clay loam).—This site is along the coast and inland between Goldbluffs beach and Prairie Creek and in areas northeast of Orick and east of the Prairie Creek. It is on uniform to slightly convex summits, shoulders, and backslopes of hills and steep mountain slopes. Hillslopes are strongly sloping to steep. The soils are well drained, very deep, and formed in colluvium and residuum derived from weakly consolidated sandstone and conglomerate of the Prairie Creek formation.

This site has an overstory almost completely dominated by redwood (*Sequoia sempervirens*). Disturbance, however, has modified species composition on some sites, leading to moderate amounts of Douglas-fir (*Pseudotsuga menziesii*). Western hemlock (*Tsuga heterophylla*) is also on most sites in very small amounts. The understory is dominated by forbs with western swordfern (*Polystichum munitum*) and redwood-sorrel (*Oxalis oregana*). The shrub layer, though sparse, is on most sites and consists of California huckleberry (*Vaccinium ovatum*) and, in some instances, salal (*Gaultheria shallon*).

F004BX108CA, *Sequoia sempervirens*/*Polystichum munitum* (Redwood/western swordfern, mountain slopes, sandstone and schist, clay loam).—This ecological site is generally in close proximity to the coast throughout the survey area. It is on uniform to slightly convex summits and shoulders of broad ridges and slightly concave to convex positions on mountain slopes. The mountain slopes are gently sloping to very steep. The soils are well drained and formed in colluvium and residuum derived dominantly from sandstone and mudstone with small areas weathered from schist.

The site is dominated by redwood (*Sequoia sempervirens*) with small amounts of Douglas-fir (*Pseudotsuga menziesii*). Douglas-fir is not on all sites, and Sitka spruce

(*Picea sitchensis*) is the more common species in many areas near the coast. Both western hemlock (*Tsuga heterophylla*) and red alder (*Alnus rubra*) are present in small amounts in some of these sites. The understory is dominated by western swordfern (*Polystichum munitum*) with occasional patches of California huckleberry (*Vaccinium ovatum*), salmonberry (*Rubus spectabilis*), and salal (*Gaultheria shallon*).

F004BX109CA, *Pseudotsuga menziesii*–*Sequoia sempervirens*/Lithocarpus densiflorus–*Vaccinium ovatum* (Douglas-fir–redwood/tanoak–California huckleberry, mountain slopes, sandstone and schist, clay loam).—This ecological site is within the Mill Creek and Rock Creek watersheds. It is on dry, uniform to slightly convex summits and shoulders of broad ridges and upper mountain slopes. The mountain slopes are gently sloping to steep. The soils are well drained and formed in colluvium and residuum derived dominantly from sandstone and mudstone with small areas weathered from schist.

The site is dominated by Douglas-fir (*Pseudotsuga menziesii*) and redwood (*Sequoia sempervirens*) with tanoak (*Lithocarpus densiflorus*) in the subcanopy. Pacific madrone (*Arbutus menziesii*) is also present in small amounts on some sites. Tanoak and California huckleberry (*Vaccinium ovatum*) are in the shrub layer.

F004BX110CA, *Picea sitchensis*–*Alnus rubra*/Rubus spectabilis–*Polystichum munitum* (Sitka spruce–red alder/salmonberry/western swordfern, hills, sandstone and mudstone, clay loam).—This ecological site is along the immediate coast throughout the survey area. It is on moist, uniform to slightly convex summits, shoulders, and backslopes of hills and debris slide areas. The hillslopes are moderately steep to very steep. The soils are well drained, very deep, and formed in colluvium and residuum derived from sandstone and mudstone.

The site is dominated by Sitka spruce (*Picea sitchensis*) and red alder (*Alnus rubra*) in the overstory with redwood (*Sequoia sempervirens*) as a rare associate. Sitka spruce and red alder are in a mosaic pattern due to disturbances. Douglas-fir (*Pseudotsuga menziesii*) is a codominant on a few sites, but not commonly. The understory is dominated by salmonberry (*Rubus spectabilis*) and western swordfern (*Polystichum munitum*). On some sites salal (*Gaultheria shallon*) coexists with the salmonberry.

F004BX111CA, *Sequoia sempervirens*/Polystichum munitum–*Oxalis oregana* (Redwood/western swordfern–redwood-sorrel, flood plains and terraces, loam).—This ecological site is throughout the survey area. It is on low terraces, alluvial fans, fan remnants, and moist valley floors near creeks and rivers. Slopes are nearly level and gently sloping. The soils are very poorly drained to well drained, very deep, and formed in alluvium derived from mixed sources.

The site is comprised of redwood (*Sequoia sempervirens*) in the overstory with western swordfern (*Polystichum munitum*) in the understory. Small groups or individuals of Sitka spruce (*Picea sitchensis*), western hemlock (*Tsuga heterophylla*), or Douglas-fir (*Pseudotsuga menziesii*) are present in some places throughout the site. Grand fir (*Abies grandis*) is present in a few places. The understory is dominated by western swordfern (*Polystichum munitum*), deer fern (*Blechnum spicant*), and redwood-sorrel (*Oxalis oregana*); salal (*Gaultheria shallon*) is in small amounts in some places. Moist areas also include rushes (*Juncus* spp.), sedges (*Carex* spp.), and American skunkcabbage (*Lysichiton americanus*).

F004BX112CA, *Quercus garryana*/Dactylis glomerata (Oregon white oak/ orchardgrass, lower mountain slopes, sandstone and mudstone, silty clay loam).—This ecological site is east of Redwood Creek. It is on uniform to slightly convex shoulders of broad ridges and upper mountain slopes. The mountain slopes are steep and very steep. The soils are somewhat poorly drained, very deep, and formed in colluvium and residuum derived from sandstone and mudstone.

The existing plant community is dominated by Oregon white oak (*Quercus garryana*) with an understory of orchardgrass (*Dactylis glomerata*), woodland strawberry (*Fragaria vesca*), sanicle (*Sanicula* spp.), and vetch (*Vicia* spp.).

F004BX113CA, *Pseudotsuga menziesii*–*Chrysolepis chrysophylla*/*Vaccinium ovatum* (Douglas-fir–giant chinquapin/California huckleberry, ridgetops, soft sandstone, clay loam).—This ecological site is on and near Childs Hill in the Mill Creek watershed. It is on uniform to slightly convex summits and shoulders of broad ridges and upper mountain slopes. The mountain slopes are nearly level to moderately steep. The soils are well drained, very deep, and formed in colluvium and residuum derived from weakly consolidated sandstone and conglomerate of the Wimer Formation.

The site is dominated by an overstory of Douglas-fir (*Pseudotsuga menziesii*) with giant chinquapin (*Chrysolepis chrysophylla*) and tanoak (*Lithocarpus densiflorus*) in the subcanopy. Shrubs dominate the understory, including California huckleberry (*Vaccinium ovatum*) and Pacific rhododendron (*Rhododendron macrophyllum*). The understory cover includes common beargrass (*Xerophyllum tenax*) and western brackenfern (*Pteridium aquilinum*).

F004BX114CA, *Quercus garryana*/*Cynosurus echinatus* (Oregon white oak/bristly dogstail grass, mountain slopes, sandstone and mudstone, clay loam).—This ecological site is east of Redwood Creek. It is in uniform positions on mountain slopes. The soils are dominantly well drained and formed in colluvium weathered from sandstone and mudstone.

The existing plant community is dominated by Oregon white oak (*Quercus garryana*) in the overstory. The understory is dominated by bristly dogstail grass (*Cynosurus echinatus*) and woodland strawberry (*Fragaria vesca*). The shrub cover is low and may include creeping snowberry (*Symphoricarpos mollis*) and Pacific poison oak (*Toxicodendron diversilobum*).

F004BX115CA, *Pseudotsuga menziesii*–*Sequoia sempervirens*/*Vaccinium ovatum* (Douglas-fir–redwood/California huckleberry, mountain slopes, schist, very gravelly loam).—This ecological site is on mountain slopes west of Redwood Creek. It is on slightly convex to strongly convex shoulders of broad ridges and strongly sloping to steep mountain slopes. The soils are well drained, moderately deep, and formed in colluvium and residuum weathered from schist.

The site is dominated by Douglas-fir (*Pseudotsuga menziesii*) with a small amount of redwood (*Sequoia sempervirens*). Redwood is not on all sites. A moderate amount of tanoak (*Lithocarpus densiflorus*) is in the subcanopy with Pacific madrone (*Arbutus menziesii*) in some places. The understory is dominated by shrubs and includes tanoak, salal (*Gaultheria shallon*), and California huckleberry (*Vaccinium ovatum*). The herbaceous cover is either very limited in extent or not present.

F005XB101CA, *Pseudotsuga menziesii*–*Lithocarpus densiflorus*/*Lithocarpus densiflorus* (Douglas-fir–tanoak/tanoak, mountain slopes, sandstone and mudstone, clay loam).—This ecological site is near Beaver and Pine Ridge. It is on uniform to slightly convex summits of broad ridges. The mountain slopes are strongly sloping and moderately steep. The soils are well drained, very deep, and formed in colluvium and residuum derived from sandstone.

The site is dominated by Douglas-fir (*Pseudotsuga menziesii*) with a subcanopy of tanoak (*Lithocarpus densiflorus*) and Pacific madrone (*Arbutus menziesii*). The dominant shrub species in the understory is tanoak. The understory also includes small amounts of Cascade barberry (*Mahonia nervosa*). The dominant herbaceous species include modesty (*Whipplea modesta*) and western brackenfern (*Pteridium aquilinum*).

F005XB102CA, *Pseudotsuga menziesii*–*Lithocarpus densiflorus*/*Lithocarpus densiflorus* (Douglas-fir–tanoak/tanoak, mountain slopes, sandstone and mudstone, very gravelly clay loam).—This ecological site is near Beaver and Pine Ridge. It is on uniform to slightly convex summits of broad ridges and mountain slopes. The mountain slopes are strongly sloping to very steep. The soils are well drained, very deep, and formed in colluvium and residuum derived from sandstone and mudstone.

The site is dominated by Douglas-fir (*Pseudotsuga menziesii*) with a subcanopy of tanoak (*Lithocarpus densiflorus*) and Pacific madrone (*Arbutus menziesii*). The shrub

layer is dominantly tanoak. The herbaceous cover is dominantly modesty (*Whipplea modesta*).

F005XB103CA, *Pseudotsuga menziesii*–*Quercus chrysolepis*/*Lithocarpus densiflorus* var. *echinoides* (Douglas-fir–canyon live oak/tanoak, mountain slopes, sandstone and mudstone, very gravelly loam).—This ecological site is near Beaver and Pine Ridge. It is on uniform to slightly convex mountain slopes. The mountain slopes are steep and very steep. The soils are well drained and formed in colluvium and residuum derived from sandstone and mudstone.

The site is dominated by Douglas-fir (*Pseudotsuga menziesii*) with canyon live oak (*Quercus chrysolepis*) as a subordinate species. The fire regime may lead to patches or mosaics of both species. Tanoak (*Lithocarpus densiflorus*) and canyon live oak dominate the shrub understory.

F005XB104CA, *Pinus jeffreyi*/*Quercus vacciniifolia* (Jeffrey pine/huckleberry oak, mountain slopes, serpentinite and peridotite, clay loam).—This ecological site is on the eastern margins of Mill Creek and Rock Creek. It is on mountain slopes and ridges. The mountain slopes are strongly sloping to very steep. The soils are well drained, very deep, and formed in colluvium and residuum derived from serpentine, peridotite, and serpentinitized peridotite of the Klamath terrane.

The site is dominated by Jeffrey pine (*Pinus jeffreyi*) with an understory dominated by huckleberry oak (*Quercus vacciniifolia*) and pinemat manzanita (*Arctostaphylos nevadensis*). The herbaceous cover is dominated by Idaho fescue (*Festuca idahoensis*) and California fescue (*Festuca californica*).

F005XB105CA, *Pseudotsuga menziesii*–*Lithocarpus densiflorus*/*Quercus vacciniifolia* (Douglas-fir/huckleberry oak, mountain slopes, serpentinite and peridotite, clay loam).—This ecological site is on the eastern margins of Mill Creek and Rock Creek. It is on lower mountain slopes. The mountain slopes are strongly sloping to very steep. The soils are well drained, very deep, and formed in colluvium and residuum derived from serpentine, peridotite, and serpentinitized peridotite of the Klamath terrane.

The site is dominated by Douglas-fir (*Pseudotsuga menziesii*) in the overstory. The understory is dominated by shrubs. The main shrubs are huckleberry oak (*Quercus vacciniifolia*), Pacific rhododendron (*Rhododendron macrophyllum*), and various manzanita species, including sticky whiteleaf manzanita (*Arctostaphylos viscida*) and pinemat manzanita (*Arctostaphylos nevadensis*). Other common shrubs may include red huckleberry (*Vaccinium parvifolium*) and California buckthorn (*Rhamnus californica*).

Rangeland

Loretta J. Metz, Marchel Munnecke, and Kendra Moseley, rangeland management specialists, and Judy Welles, forester, Natural Resources Conservation Service, prepared this section.

Rangeland, sometimes referred to as “wildland,” has native vegetation consisting of grasses, grasslike plants, forbs, shrubs, and trees with a total tree canopy cover of less than 25 percent. The vegetation in areas of rangeland provides many habitat components, helps to control erosion, may be suitable for grazing or browsing by wildlife and domestic animals, and offers scenic and recreational opportunities. Rangeland is important environmentally and economically.

Characterization and Management

Rangeland is characterized and quantified based on its ability to produce various kinds, proportions, and amounts of plants. The plant communities are largely dependent on the soils, climate, topography, aspect, slope, and other abiotic features of the landscape. To assist in the understanding of soil-plant interactions and the effects of selected management practices, the Natural Resources Conservation

Service classifies rangeland into ecological sites. An ecological site is a distinctive kind of land with specific physical characteristics that differs from other kinds of land in its ability to produce a distinctive kind and amount of vegetation (USDA–NRCS, National Range and Pasture Handbook; no date).

Soil types and plant communities are correlated and serve as the basis for the development of ecological site descriptions. Soil properties that affect moisture supply and plant nutrients, such as texture, depth, and amount of coarse fragments, have the greatest influence on the productivity of rangeland plants and the composition and distribution of the plant community. Soil reaction, salt content, fog drip, and a seasonal high water table are also important. Geography and climate influence the location of plant communities across the landscape and affect various soil properties. For example, soils on southerly and westerly slopes commonly support chaparral-type species and plant communities as a result of the intense heat, high evapotranspiration rate, and resultant droughtiness. Soils on northerly and easterly slopes are exposed to less solar radiation and generally support forestland species and plant communities. Differences in the soil properties that affect the composition, production, and distribution of plant communities are considered in correlating ecological sites to individual soil map unit components.

Table 8 shows, for each map unit in the survey area that supports rangeland vegetation, the ecological site; the total annual production of vegetation in favorable, normal, and unfavorable years; the characteristic vegetation; and the expected composition of each species.

An *ecological site* is the product of all the environmental factors responsible for its development. It has characteristic soils that have developed over time throughout the soil development process; a characteristic hydrology, particularly infiltration and runoff, which has developed over time; and a characteristic plant community (kind and amount of vegetation). The hydrology of the site is influenced by development of the soil and plant community. The vegetation, soils, and hydrology are all interrelated. Each is influenced by the others and influences the development of the others. The plant community on an ecological site is typified by an association of species that differs from that of other ecological sites in the kind and/or proportion of species or in total production.

Total dry-weight production is the amount of vegetation that can be expected to grow annually in a well managed area that is supporting the potential natural plant community. It includes all vegetation, whether or not it is palatable to grazing animals. It includes the current year's growth of leaves, twigs, and fruits of woody plants. It does not include the increase in stem diameter of trees and shrubs. It is expressed in pounds per acre of air-dry vegetation for favorable, normal, and unfavorable years. In a favorable year, the amount and distribution of precipitation and the temperatures make growing conditions substantially better than average. In a normal year, growing conditions are about average. In an unfavorable year, growing conditions are well below average, generally because of low available soil moisture.

Yields are adjusted to a common percent of air-dry moisture content. The relationship of green weight to air-dry weight varies according to such factors as exposure, amount of shade, recent rains, and unseasonable dry periods. The total production figures can be used to calculate carrying capacity and stocking rates for management of domestic animals or wildlife and to determine fuel loading for prescribed burning or fire modeling.

Characteristic vegetation is the grasses, grasslike plants, forbs, and shrubs that make up most of the potential natural plant community. The species are listed by common name. Table 9 is an index that cross-references common names, scientific names, and symbols from the PLANTS database. All of the plant names are correlated directly with the PLANTS database (<http://plants.usda.gov>).

Under *species composition*, the expected percentage of the total annual production is given for each species making up the characteristic vegetation. The amount that can be used as forage depends on the kinds of grazing animals and on the grazing season.

Rangeland Ecological Sites

A brief description of each rangeland ecological site in the survey area is given in the following paragraphs. A complete description of each can be obtained at the local office of the Natural Resources Conservation Service or from the Web site of the Ecological Site Information System at <http://esis.sc.egov.usda.gov/>. See table 8 for the specific soils in the survey area that are correlated to each ecological site.

R004BX101CA, Upper prairie, mountain slopes, sandstone and mudstone, clay loam.—This ecological site is east of Redwood Creek in the Bald Hills. It is on uniform to slightly convex summits and shoulders of broad ridges and upper mountain slopes. The soils are well drained and formed in colluvium and residuum derived from sandstone and mudstone.

The existing plant community is dominated by tall oatgrass (*Arrhenatherum elatius*), annual vernalgrass (*Anthoxanthum aristatum*), bentgrass (*Agrostis*), and bristly dogstail grass (*Cynosurus echinatus*). Forbs include common sheep sorrel (*Rumex acetosella*), hairy cat's ear (*Hypochaeris radicata*), and western brackenfern (*Pteridium aquilinum*).

R004BX102CA, Coastal scrub and prairie, hills, sandstone and mudstone, gravelly clay loam.—This ecological site is along the immediate coast throughout the survey area. It is on moist, uniform to slightly convex summits, shoulders, and backslopes of hills and debris slide areas. The hillslopes are strongly sloping to steep. The soils are well drained, very deep, and formed in colluvium and residuum derived from mudstone and sandstone.

The existing plant community is a complex mosaic of coastal scrub and prairie and is comprised of perennial grasses and forbs. Dominant perennials grasses include various fescues (*Festuca* spp.), tall oatgrass (*Arrhenatherum elatius*), and sweet vernalgrass (*Anthoxanthum aristatum*). Shrubs and woody vines, such as coyotebrush (*Baccharis pilularis*), California buckthorn (*Rhammus californica*), thimbleberry (*Rubus parviflorus*), California blackberry (*Rubus ursinus*) and Himalayan blackberry (*Rubus discolor*), are also present. Cow parsnip (*Heracleum* spp.) is common on some sites.

R004BX103CA, Lower prairie, earthflows, sandstone and mudstone, gravelly loam.—This ecological site is east of Redwood Creek. It is in uniform to slightly concave slump positions on lower mountain slopes. The mountain slopes are moderately steep and steep. The soils are moderately well drained or somewhat poorly drained, very deep, and formed in colluvium derived from earthflow deposits of mudstone and sandstone.

The existing plant community is dominated by herbaceous species, such as bristly dogstail grass (*Cynosurus echinatus*), orchardgrass (*Dactylis glomerata*), annual vernalgrass (*Anthoxanthum aristatum*), and hairy cat's ear (*Hypochaeris radicata*). Shrubs species, such as coyotebrush (*Baccharis pilularis*) and Scotch broom (*Cytisus scoparius*), are also present on some sites.

R004BX104CA, Middle prairie, mountain slopes, sandstone and mudstone, gravelly clay loam.—This ecological site is east of Redwood Creek. It is in uniform to slightly concave slump positions on middle mountain slopes. The soils are well drained, very deep, and formed in colluvium derived from earthflow deposits of mudstone and sandstone.

The existing plant community is dominated by blue wildrye (*Elymus glaucus*), soft chess brome (*Bromus hordeaceus*), tall oatgrass (*Arrhenatherum elatius*), and bristly dogstail grass (*Cynosurus echinatus*). Some Scotch broom (*Cytisus scoparius*) is present on some sites.

Recreation

The soils of the survey area are rated in table 10a and table 10b according to limitations that affect their suitability for recreation. The ratings are both descriptive and numerical. Rating class terms indicate the extent to which the soils are limited by all of the soil features that affect the recreational uses. *No limitations* indicates that the soil has features that are very favorable for the specified use. Good performance and very low maintenance can be expected. *Limitations* indicates that the soil has some features that are favorable for the specified use and some that are unfavorable. Ratings between 0.01 and 1.00 indicate limitations that can be overcome or minimized by special planning, design, or installation. Fair performance and moderate maintenance can be expected. Limitations with a rating of 1.00 indicate that the soil has one or more features that are unfavorable for the specified use. The limitations generally cannot be overcome without major soil reclamation, special design, or expensive installation procedures. Poor performance and high maintenance can be expected.

Numerical ratings in the tables indicate the severity of individual limitations. The ratings are shown as decimal fractions ranging from 0.01 to 1.00. They indicate gradations between the point at which a soil feature has the greatest negative impact on the use (1.00) and the point at which the soil feature is not a limitation (0.00). Values of 0.00 are not shown in the tables.

The ratings in the tables are based on restrictive soil features, such as wetness, slope, and texture of the surface layer. Susceptibility to flooding is considered. Not considered in the ratings, but important in evaluating a site, are the location and accessibility of the area, the size and shape of the area and its scenic quality, vegetation, access to water, potential water impoundment sites, and access to public sewer lines. The capacity of the soil to absorb septic tank effluent and the ability of the soil to support vegetation also are important. Soils that are subject to flooding are limited for recreational uses by the duration and intensity of flooding and the season when flooding occurs. In planning recreational facilities, onsite assessment of the height, duration, intensity, and frequency of flooding is essential.

The information in the tables can be supplemented by other information in this survey, for example, interpretations for building site development, construction materials, sanitary facilities, and water management.

Table 10a

Camp areas require site preparation, such as shaping and leveling the tent and parking areas, stabilizing roads and intensively used areas, and installing sanitary facilities and utility lines. Camp areas are subject to heavy foot traffic and some vehicular traffic. The ratings are based on the soil properties that affect the ease of developing camp areas and the performance of the areas after development. Slope, stoniness, and depth to bedrock or a cemented pan are the main concerns affecting the development of camp areas. The soil properties that affect the performance of the areas after development are those that influence trafficability and promote the growth of vegetation, especially in heavily used areas. For good trafficability, the surface of camp areas should absorb rainfall readily, remain firm under heavy foot traffic, and not be dusty when dry. The soil properties that influence trafficability are texture of the surface layer, depth to a water table, ponding, flooding, permeability, and large stones. The soil properties that affect the growth of plants are depth to bedrock or a cemented pan, permeability, and toxic substances in the soil.

Picnic areas are subject to heavy foot traffic. Most vehicular traffic is confined to access roads and parking areas. The ratings are based on the soil properties that affect the ease of developing picnic areas and that influence trafficability and the growth of vegetation after development. Slope and stoniness are the main concerns affecting the development of picnic areas. For good trafficability, the surface of picnic

areas should absorb rainfall readily, remain firm under heavy foot traffic, and not be dusty when dry. The soil properties that influence trafficability are texture of the surface layer, depth to a water table, ponding, flooding, permeability, and large stones. The soil properties that affect the growth of plants are depth to bedrock or a cemented pan, permeability, and toxic substances in the soil.

Playgrounds require soils that are nearly level, are free of stones, and can withstand intensive foot traffic. The ratings are based on the soil properties that affect the ease of developing playgrounds and that influence trafficability and the growth of vegetation after development. Slope and stoniness are the main concerns affecting the development of playgrounds. For good trafficability, the surface of the playgrounds should absorb rainfall readily, remain firm under heavy foot traffic, and not be dusty when dry. The soil properties that influence trafficability are texture of the surface layer, depth to a water table, ponding, flooding, permeability, and large stones. The soil properties that affect the growth of plants are depth to bedrock or a cemented pan, permeability, and toxic substances in the soil.

Table 10b

Paths and trails for hiking and horseback riding should require little or no slope modification through cutting and filling. The ratings are based on the soil properties that affect trafficability and erodibility. These properties are stoniness, depth to a water table, ponding, flooding, slope, and texture of the surface layer.

Off-road motorcycle trails require little or no site preparation. They are not covered with surfacing material or vegetation. Considerable compaction of the soil material is likely. The ratings are based on the soil properties that influence erodibility, trafficability, dustiness, and the ease of revegetation. These properties are stoniness, slope, depth to a water table, ponding, flooding, and texture of the surface layer.

Lawns, landscaping, and golf fairways are subject to heavy foot traffic and some light vehicular traffic and require soils on which turf, ornamental trees, and shrubs can be established and maintained. Cutting or filling may be required. Irrigation is not considered in the ratings. The ratings are based on the soil properties that affect plant growth and trafficability after vegetation is established. The properties that affect plant growth are reaction; depth to a water table; ponding; depth to bedrock or a cemented pan; the available water capacity in the upper 40 inches; the content of salts, sodium, or calcium carbonate; and sulfidic materials. The properties that affect trafficability are flooding, depth to a water table, ponding, slope, stoniness, and the amount of sand, clay, or organic matter in the surface layer. The suitability of the soil for traps, tees, roughs, and greens is not considered in the ratings.

Engineering

This section provides information for planning land uses related to urban development and to water management. Soils are rated for various uses, and the most limiting features are identified. Ratings are given for building site development, sanitary facilities, construction materials, and water management. The ratings are based on observed performance of the soils and on the estimated and test data in the tables described under the heading "Soil Properties."

Information in this section is intended for land use planning, for evaluating land use alternatives, and for planning site investigations prior to design and construction. The information, however, has limitations. For example, estimates and other data generally apply only to that part of the soil between the surface and a depth of 5 to 7 feet. Because of the map scale, small areas of different soils may be included within the mapped areas of a specific soil.

The information is not site specific and does not eliminate the need for onsite investigation of the soils or for testing and analysis by personnel experienced in the design and construction of engineering works.

Government ordinances and regulations that restrict certain land uses or impose specific design criteria were not considered in preparing the information in this section. Local ordinances and regulations should be considered in planning, in site selection, and in design.

Soil properties, site features, and observed performance were considered in determining the ratings in this section. During the fieldwork for this soil survey, determinations were made about particle-size distribution, liquid limit, plasticity index, soil reaction, depth to bedrock, hardness of bedrock within 5 to 7 feet of the surface, soil wetness, depth to a water table, ponding, slope, likelihood of flooding, natural soil structure aggregation, and soil density. Data were collected about kinds of clay minerals, mineralogy of the sand and silt fractions, and the kinds of adsorbed cations. Estimates were made for erodibility, permeability, corrosivity, shrink-swell potential, available water capacity, and other behavioral characteristics affecting engineering uses.

This information can be used to evaluate the potential of areas for residential, commercial, industrial, and recreational uses; make preliminary estimates of construction conditions; evaluate alternative routes for roads, streets, highways, pipelines, and underground cables; evaluate alternative sites for sanitary landfills, septic tank absorption fields, and sewage lagoons; plan detailed onsite investigations of soils and geology; locate potential sources of gravel, sand, earthfill, and topsoil; plan drainage systems, irrigation systems, ponds, terraces, and other structures for soil and water conservation; and predict performance of proposed small structures and pavements by comparing the performance of existing similar structures on the same or similar soils.

The information in the tables, along with the soil maps, the soil descriptions, and other data provided in this survey, can be used to make additional interpretations.

Some of the terms used in this soil survey have a special meaning in soil science and are defined in the Glossary.

Building Site Development

Soil properties influence the development of building sites, including the selection of the site, the design of the structure, construction, performance after construction, and maintenance. Table 11a and table 11b show the degree and kind of soil limitations that affect dwellings with and without basements, small commercial buildings, local roads and streets, and shallow excavations.

The ratings in the tables are both descriptive and numerical. Rating class terms indicate the extent to which the soils are limited by all of the soil features that affect building site development. *Not limited* indicates that the soil has features that are very favorable for the specified use. Good performance and very low maintenance can be expected. *Somewhat limited* indicates that the soil has features that are moderately favorable for the specified use. The limitations can be overcome or minimized by special planning, design, or installation. Fair performance and moderate maintenance can be expected. *Very limited* indicates that the soil has one or more features that are unfavorable for the specified use. The limitations generally cannot be overcome without major soil reclamation, special design, or expensive installation procedures. Poor performance and high maintenance can be expected.

Numerical ratings in the tables indicate the severity of individual limitations. The ratings are shown as decimal fractions ranging from 0.01 to 1.00. They indicate gradations between the point at which a soil feature has the greatest negative impact on the use (1.00) and the point at which the soil feature is not a limitation (0.00). Values of 0.00 are not shown in the tables.

Table 11a

Dwellings are single-family houses of three stories or less. For dwellings without basements, the foundation is assumed to consist of spread footings of reinforced

concrete built on undisturbed soil at a depth of 2 feet or at the depth of maximum frost penetration, whichever is deeper. For dwellings with basements, the foundation is assumed to consist of spread footings of reinforced concrete built on undisturbed soil at a depth of about 7 feet. The ratings for dwellings are based on the soil properties that affect the capacity of the soil to support a load without movement and on the properties that affect excavation and construction costs. The properties that affect the load-supporting capacity include depth to a water table, ponding, flooding, subsidence, linear extensibility (shrink-swell potential), and compressibility. Compressibility is inferred from the Unified classification. The properties that affect the ease and amount of excavation include depth to a water table, ponding, flooding, slope, depth to bedrock or a cemented pan, hardness of bedrock or a cemented pan, and the amount and size of rock fragments.

Small commercial buildings are structures that are less than three stories high and do not have basements. The foundation is assumed to consist of spread footings of reinforced concrete built on undisturbed soil at a depth of 2 feet or at the depth of maximum frost penetration, whichever is deeper. The ratings are based on the soil properties that affect the capacity of the soil to support a load without movement and on the properties that affect excavation and construction costs. The properties that affect the load-supporting capacity include depth to a water table, ponding, flooding, subsidence, linear extensibility (shrink-swell potential), and compressibility (which is inferred from the Unified classification). The properties that affect the ease and amount of excavation include flooding, depth to a water table, ponding, slope, depth to bedrock or a cemented pan, hardness of bedrock or a cemented pan, and the amount and size of rock fragments.

Table 11b

Local roads and streets have an all-weather surface and carry automobile and light truck traffic all year. They have a subgrade of cut or fill soil material; a base of gravel, crushed rock, or soil material stabilized by lime or cement; and a surface of flexible material (asphalt), rigid material (concrete), or gravel with a binder. The ratings are based on the soil properties that affect the ease of excavation and grading and the traffic-supporting capacity. The properties that affect the ease of excavation and grading are depth to bedrock or a cemented pan, hardness of bedrock or a cemented pan, depth to a water table, ponding, flooding, the amount of large stones, and slope. The properties that affect the traffic-supporting capacity are soil strength (as inferred from the AASHTO group index number), subsidence, linear extensibility (shrink-swell potential), the potential for frost action, depth to a water table, and ponding.

Shallow excavations are trenches or holes dug to a maximum depth of 5 or 6 feet for graves, utility lines, open ditches, or other purposes. The ratings are based on the soil properties that influence the ease of digging and the resistance to sloughing. Depth to bedrock or a cemented pan, hardness of bedrock or a cemented pan, the amount of large stones, and dense layers influence the ease of digging, filling, and compacting. Depth to the seasonal high water table, flooding, and ponding may restrict the period when excavations can be made. Slope influences the ease of using machinery. Soil texture, depth to the water table, and linear extensibility (shrink-swell potential) influence the resistance to sloughing.

Sanitary Facilities

Table 12a and table 12b show the degree and kind of soil limitations that affect septic tank absorption fields, sewage lagoons, sanitary landfills, and daily cover for landfill. The ratings are both descriptive and numerical. Rating class terms indicate the extent to which the soils are limited by all of the soil features that affect these uses. *Not limited* indicates that the soil has features that are very favorable for the

specified use. Good performance and very low maintenance can be expected. *Somewhat limited* indicates that the soil has features that are moderately favorable for the specified use. The limitations can be overcome or minimized by special planning, design, or installation. Fair performance and moderate maintenance can be expected. *Very limited* indicates that the soil has one or more features that are unfavorable for the specified use. The limitations generally cannot be overcome without major soil reclamation, special design, or expensive installation procedures. Poor performance and high maintenance can be expected.

Numerical ratings in the tables indicate the severity of individual limitations. The ratings are shown as decimal fractions ranging from 0.01 to 1.00. They indicate gradations between the point at which a soil feature has the greatest negative impact on the use (1.00) and the point at which the soil feature is not a limitation (0.00). Values of 0.00 are not shown in the tables.

Table 12a

Septic tank absorption fields are areas in which effluent from a septic tank is distributed into the soil through subsurface tiles or perforated pipe. Only that part of the soil between depths of 24 and 60 inches is evaluated. The ratings are based on the soil properties that affect absorption of the effluent, construction and maintenance of the system, and public health. Permeability, depth to a water table, ponding, depth to bedrock or a cemented pan, and flooding affect absorption of the effluent. Stones and boulders, ice, and bedrock or a cemented pan interfere with installation. Subsidence interferes with installation and maintenance. Excessive slope may cause lateral seepage and surfacing of the effluent in downslope areas.

Some soils are underlain by loose sand and gravel or fractured bedrock at a depth of less than 4 feet below the distribution lines. In these soils the absorption field may not adequately filter the effluent, particularly when the system is new. As a result, the ground water may become contaminated.

Sewage lagoons are shallow ponds constructed to hold sewage while aerobic bacteria decompose the solid and liquid wastes. Lagoons should have a nearly level floor surrounded by cut slopes or embankments of compacted soil. Nearly impervious soil material for the lagoon floor and sides is required to minimize seepage and contamination of ground water. Considered in the ratings are slope, permeability, depth to a water table, ponding, depth to bedrock or a cemented pan, flooding, large stones, and content of organic matter.

Soil permeability is a critical property affecting the suitability for sewage lagoons. Most porous soils eventually become sealed when they are used as sites for sewage lagoons. Until sealing occurs, however, the hazard of pollution is severe. Soils that have a permeability rate of more than 2 inches per hour are too porous for the proper functioning of sewage lagoons. In these soils, seepage of the effluent can result in contamination of the ground water. Ground-water contamination is also a hazard if fractured bedrock is within a depth of 40 inches, if the water table is high enough to raise the level of sewage in the lagoon, or if floodwater overtops the lagoon.

A high content of organic matter is detrimental to proper functioning of the lagoon because it inhibits aerobic activity. Slope, bedrock, and cemented pans can cause construction problems, and large stones can hinder compaction of the lagoon floor. If the lagoon is to be uniformly deep throughout, the slope must be gentle enough and the soil material must be thick enough over bedrock or a cemented pan to make land smoothing practical.

Table 12b

A trench sanitary landfill is an area where solid waste is placed in successive layers in an excavated trench. The waste is spread, compacted, and covered daily with a thin layer of soil excavated at the site. When the trench is full, a final cover of soil material

at least 2 feet thick is placed over the landfill. The ratings in the table are based on the soil properties that affect the risk of pollution, the ease of excavation, trafficability, and revegetation. These properties include permeability, depth to bedrock or a cemented pan, depth to a water table, ponding, slope, flooding, texture, stones and boulders, highly organic layers, soil reaction, and content of salts and sodium. Unless otherwise stated, the ratings apply only to that part of the soil within a depth of about 6 feet. For deeper trenches, onsite investigation may be needed.

Hard, nonrippable bedrock, creviced bedrock, or highly permeable strata in or directly below the proposed trench bottom can affect the ease of excavation and the hazard of ground-water pollution. Slope affects construction of the trenches and the movement of surface water around the landfill. It also affects the construction and performance of roads in areas of the landfill.

Soil texture and consistence affect the ease with which the trench is dug and the ease with which the soil can be used as daily or final cover. They determine the workability of the soil when dry and when wet. Soils that are plastic and sticky when wet are difficult to excavate, grade, or compact and are difficult to place as a uniformly thick cover over a layer of refuse.

The soil material used as the final cover for a trench landfill should be suitable for plants. It should not have excess sodium or salts and should not be too acid. The surface layer generally has the best workability, the highest content of organic matter, and the best potential for plants. Material from the surface layer should be stockpiled for use as the final cover.

In an *area sanitary landfill*, solid waste is placed in successive layers on the surface of the soil. The waste is spread, compacted, and covered daily with a thin layer of soil from a source away from the site. A final cover of soil material at least 2 feet thick is placed over the completed landfill. The ratings in the table are based on the soil properties that affect trafficability and the risk of pollution. These properties include flooding, permeability, depth to a water table, ponding, slope, and depth to bedrock or a cemented pan.

Flooding is a serious problem because it can result in pollution in areas downstream from the landfill. If permeability is too rapid or if fractured bedrock, a fractured cemented pan, or the water table is close to the surface, the leachate can contaminate the water supply. Slope is a consideration because of the extra grading required to maintain roads in the steeper areas of the landfill. Also, leachate may flow along the surface of the soils in the steeper areas and cause difficult seepage problems.

Daily cover for landfill is the soil material that is used to cover compacted solid waste in an area sanitary landfill. The soil material is obtained offsite, transported to the landfill, and spread over the waste. The ratings in the table also apply to the final cover for a landfill. They are based on the soil properties that affect workability, the ease of digging, and the ease of moving and spreading the material over the refuse daily during wet and dry periods. These properties include soil texture, depth to a water table, ponding, rock fragments, slope, depth to bedrock or a cemented pan, reaction, and content of salts, sodium, or lime.

Loamy or silty soils that are free of large stones and excess gravel are the best cover for a landfill. Clayey soils may be sticky and difficult to spread; sandy soils are subject to wind erosion.

Slope affects the ease of excavation and of moving the cover material. Also, it can influence runoff, erosion, and reclamation of the borrow area.

After soil material has been removed, the soil material remaining in the borrow area must be thick enough over bedrock, a cemented pan, or the water table to permit revegetation. The soil material used as the final cover for a landfill should be suitable for plants. It should not have excess sodium, salts, or lime and should not be too acid.

Construction Materials

Table 13a and table 13b give information about the soils as potential sources of gravel, sand, topsoil, reclamation material, and roadfill. Normal compaction, minor processing, and other standard construction practices are assumed.

Table 13a

Gravel and *sand* are natural aggregates suitable for commercial use with a minimum of processing. They are used in many kinds of construction. Specifications for each use vary widely. In table 13a, only the likelihood of finding material in suitable quantity is evaluated. The suitability of the material for specific purposes is not evaluated, nor are factors that affect excavation of the material. The properties used to evaluate the soil as a source of gravel or sand are gradation of grain sizes (as indicated by the Unified classification of the soil), the thickness of suitable material, and the content of rock fragments. If the bottom layer of the soil contains gravel or sand, the soil is considered a likely source regardless of thickness. The assumption is that the gravel or sand layer below the depth of observation exceeds the minimum thickness.

The soils are rated *good*, *fair*, or *poor* as potential sources of sand and gravel. A rating of *good* or *fair* means that the source material is likely to be in or below the soil. The bottom layer and the thickest layer of the soils are assigned numerical ratings. These ratings indicate the likelihood that the layer is a source of sand or gravel. The numbers 0.00 to 0.07 indicate that the layer is a poor source. The numbers 0.75 to 1.00 indicate that the layer is a good source. The numbers 0.08 to 0.74 indicate the degree to which the layer is a likely source.

The soils are rated *good*, *fair*, or *poor* as potential sources of topsoil, reclamation material, and roadfill. The features that limit the soils as sources of these materials are specified in the tables. The numerical ratings given after the specified features indicate the degree to which the features limit the soils as sources of topsoil, reclamation material, or roadfill. The lower the number, the greater the limitation.

Topsoil is used to cover an area so that vegetation can be established and maintained. The upper 40 inches of a soil is evaluated for use as topsoil. Also evaluated is the reclamation potential of the borrow area. The ratings are based on the soil properties that affect plant growth; the ease of excavating, loading, and spreading the material; and reclamation of the borrow area. Toxic substances, soil reaction, and the properties that are inferred from soil texture, such as available water capacity and fertility, affect plant growth. The ease of excavating, loading, and spreading is affected by rock fragments, slope, depth to a water table, soil texture, and thickness of suitable material. Reclamation of the borrow area is affected by slope, depth to a water table, rock fragments, depth to bedrock or a cemented pan, and toxic material.

The surface layer of most soils is generally preferred for topsoil because of its organic matter content. Organic matter greatly increases the absorption and retention of moisture and nutrients for plant growth.

Table 13b

Reclamation material is used in areas that have been drastically disturbed by surface mining or similar activities. When these areas are reclaimed, layers of soil material or unconsolidated geological material, or both, are replaced in a vertical sequence. The reconstructed soil favors plant growth. The ratings in the table do not apply to quarries and other mined areas that require an offsite source of reconstruction material. The ratings are based on the soil properties that affect erosion and stability of the surface and the productive potential of the reconstructed soil. These properties include the content of sodium, salts, and calcium carbonate; reaction; available water capacity; erodibility; texture; content of rock fragments; and content of organic matter and other features that affect fertility.

Roadfill is soil material that is excavated in one place and used in road embankments in another place. In this table, the soils are rated as a source of roadfill for low embankments, generally less than 6 feet high and less exacting in design than higher embankments.

The ratings are for the whole soil, from the surface to a depth of about 5 feet. It is assumed that soil layers will be mixed when the soil material is excavated and spread.

The ratings are based on the amount of suitable material and on soil properties that affect the ease of excavation and the performance of the material after it is in place. The thickness of the suitable material is a major consideration. The ease of excavation is affected by large stones, depth to a water table, and slope. How well the soil performs in place after it has been compacted and drained is determined by its strength (as inferred from the AASHTO classification of the soil) and linear extensibility (shrink-swell potential).

Water Management

Table 14 provides information on the soil properties and site features that affect water management. The degree and kind of soil limitations are given for pond reservoir areas and for embankments, dikes, and levees. The ratings are both descriptive and numerical. Rating class terms indicate the extent to which the soils are limited by all of the soil features that affect the recreational uses. *No limitations* indicates that the soil has features that are very favorable for the specified use. Good performance and very low maintenance can be expected. *Limitations* indicates that the soil has some features that are favorable for the specified use and some that are unfavorable. Ratings between 0.01 and 1.00 indicate limitations that can be overcome or minimized by special planning, design, or installation. Fair performance and moderate maintenance can be expected. Limitations with a rating of 1.00 indicate that the soil has one or more features that are unfavorable for the specified use. The limitations generally cannot be overcome without major soil reclamation, special design, or expensive installation procedures. Poor performance and high maintenance can be expected.

Numerical ratings in the tables indicate the severity of individual limitations. The ratings are shown as decimal fractions ranging from 0.01 to 1.00. They indicate gradations between the point at which a soil feature has the greatest negative impact on the use (1.00) and the point at which the soil feature is not a limitation (0.00). Values of 0.00 are not shown in the tables.

Embankments, dikes, and levees are raised structures of soil material, generally less than 20 feet high, constructed to impound water or to protect land against overflow. Embankments that have zoned construction (core and shell) are not considered. In this table, the soils are rated as a source of material for embankment fill. The ratings apply to the soil material below the surface layer to a depth of about 5 feet. It is assumed that soil layers will be uniformly mixed and compacted during construction.

The ratings do not indicate the ability of the natural soil to support an embankment. Soil properties to a depth even greater than the height of the embankment can affect performance and safety of the embankment. Generally, deeper onsite investigation is needed to determine these properties.

Soil material in embankments must be resistant to seepage, piping, and erosion and have favorable compaction characteristics. Unfavorable features include less than 5 feet of suitable material and a high content of stones or boulders, organic matter, or salts or sodium. A high water table affects the amount of usable material. It also affects trafficability.

Pond reservoir areas hold water behind a dam or embankment. Soils best suited to this use have low seepage potential in the upper 60 inches. The seepage potential is determined by the permeability of the soil and the depth to fractured bedrock or other permeable material. Excessive slope can affect the storage capacity of the reservoir area.

Soil Properties

Data relating to soil properties are collected during the course of the soil survey.

Soil properties are ascertained by field examination of the soils and by laboratory index testing of some benchmark soils. Established standard procedures are followed. During the survey, many shallow borings are made and examined to identify and classify the soils and to delineate them on the soil maps. Samples are taken from some typical profiles and tested in the laboratory to determine particle-size distribution, plasticity, and compaction characteristics.

Estimates of soil properties are based on field examinations, on laboratory tests of samples from the survey area, and on laboratory tests of samples of similar soils in nearby areas (USDA, 1995). Tests verify field observations, verify properties that cannot be estimated accurately by field observation, and help to characterize key soils.

The estimates of soil properties are shown in tables. They include engineering properties, physical and chemical properties, and pertinent soil and water features.

Engineering Properties

Table 15 gives the engineering classifications and the range of properties for the layers of each soil in the survey area.

Depth to the upper and lower boundaries of each layer is indicated.

Texture is given in the standard terms used by the U.S. Department of Agriculture. These terms are defined according to percentages of sand, silt, and clay in the fraction of the soil that is less than 2 millimeters in diameter. "Loam," for example, is soil that is 7 to 27 percent clay, 28 to 50 percent silt, and less than 52 percent sand. If the content of particles coarser than sand is 15 percent or more, an appropriate modifier is added, for example, "gravelly." Textural terms are defined in the Glossary.

Classification of the soils is determined according to the Unified soil classification system (ASTM, 2001) and the system adopted by the American Association of State Highway and Transportation Officials (AASHTO, 2000).

The Unified system classifies soils according to properties that affect their use as construction material. Soils are classified according to particle-size distribution of the fraction less than 3 inches in diameter and according to plasticity index, liquid limit, and organic matter content. Sandy and gravelly soils are identified as GW, GP, GM, GC, SW, SP, SM, and SC; silty and clayey soils as ML, CL, OL, MH, CH, and OH; and highly organic soils as PT. Soils exhibiting engineering properties of two groups can have a dual classification, for example, CL-ML.

The AASHTO system classifies soils according to those properties that affect roadway construction and maintenance. In this system, the fraction of a mineral soil that is less than 3 inches in diameter is classified in one of seven groups from A-1 through A-7 on the basis of particle-size distribution, liquid limit, and plasticity index. Soils in group A-1 are coarse grained and low in content of fines (silt and clay). At the other extreme, soils in group A-7 are fine grained. Highly organic soils are classified in group A-8 on the basis of visual inspection.

If laboratory data are available, the A-1, A-2, and A-7 groups are further classified as A-1-a, A-1-b, A-2-4, A-2-5, A-2-6, A-2-7, A-7-5, or A-7-6. As an additional refinement,

the suitability of a soil as subgrade material can be indicated by a group index number. Group index numbers range from 0 for the best subgrade material to 20 or higher for the poorest.

Rock fragments larger than 10 inches in diameter and 3 to 10 inches in diameter are indicated as a percentage of the total soil on a dry-weight basis. The percentages are estimates determined mainly by converting volume percentage in the field to weight percentage.

Percentage (of soil particles) passing designated sieves is the percentage of the soil fraction less than 3 inches in diameter based on an oven-dry weight. The sieves, numbers 4, 10, 40, and 200 (USA Standard Series), have openings of 4.76, 2.00, 0.420, and 0.074 millimeters, respectively. Estimates are based on laboratory tests of soils sampled in the survey area and in nearby areas and on estimates made in the field.

Liquid limit and *plasticity index* (Atterberg limits) indicate the plasticity characteristics of a soil. The estimates are based on test data from the survey area or from nearby areas and on field examination.

The estimates of particle-size distribution, liquid limit, and plasticity index are generally rounded to the nearest 5 percent. Thus, if the ranges of gradation and Atterberg limits extend a marginal amount (1 or 2 percentage points) across classification boundaries, the classification in the marginal zone is generally omitted in the table.

Physical Properties

Table 16 shows estimates of some physical characteristics and features that affect soil behavior. These estimates are given for the layers of each soil in the survey area. The estimates are based on field observations and on test data for these and similar soils.

Depth to the upper and lower boundaries of each layer is indicated.

Particle size is the effective diameter of a soil particle as measured by sedimentation, sieving, or micrometric methods. Particle sizes are expressed as classes with specific effective diameter class limits. The broad classes are sand, silt, and clay, ranging from the larger to the smaller.

Clay as a soil separate consists of mineral soil particles that are less than 0.002 millimeter in diameter. In table 16, the estimated clay content of each soil layer is given as a percentage, by weight, of the soil material that is less than 2 millimeters in diameter.

The content of sand, silt, and clay affects the physical behavior of a soil. Particle size is important for engineering and agronomic interpretations, for determination of soil hydrologic qualities, and for soil classification.

The amount and kind of clay affect the fertility and physical condition of the soil and the ability of the soil to adsorb cations and to retain moisture. They influence shrink-swell potential, permeability, plasticity, the ease of soil dispersion, and other soil properties. The amount and kind of clay in a soil also affect tillage and earthmoving operations.

Moist bulk density is the weight of soil (oven-dry) per unit volume. Volume is measured when the soil is at field moisture capacity, that is, the moisture content at $1/3$ - or $1/10$ -bar (33kPa or 10kPa) moisture tension. Weight is determined after the soil is dried at 105 degrees C. In the table, the estimated moist bulk density of each soil horizon is expressed in grams per cubic centimeter of soil material that is less than 2 millimeters in diameter. Bulk density data are used to compute shrink-swell potential, available water capacity, total pore space, and other soil properties. The moist bulk density of a soil indicates the pore space available for water and roots. Depending on soil texture, a bulk density of more than 1.4 can restrict water storage and root

penetration. Moist bulk density is influenced by texture, kind of clay, content of organic matter, and soil structure.

Saturated hydraulic conductivity refers to the ability of a soil to transmit water or air. The term "permeability," as used in soil surveys, indicates saturated hydraulic conductivity (Ksat). The estimates in the table indicate the rate of water movement, in micrometers per second ($\mu\text{m}/\text{sec}$), when the soil is saturated. They are based on soil characteristics observed in the field, particularly structure, porosity, and texture. Permeability is considered in the design of soil drainage systems and septic tank absorption fields.

Available water capacity refers to the quantity of water that the soil is capable of storing for use by plants. The capacity for water storage is given in inches of water per inch of soil for each soil layer. The capacity varies, depending on soil properties that affect retention of water. The most important properties are the content of organic matter, soil texture, bulk density, and soil structure. Available water capacity is an important factor in the choice of plants or crops to be grown and in the design and management of irrigation systems. Available water capacity is not an estimate of the quantity of water actually available to plants at any given time.

Linear extensibility refers to the change in length of an unconfined clod as moisture content is decreased from a moist to a dry state. It is an expression of the volume change between the water content of the clod at $1/3$ - or $1/10$ -bar tension (33kPa or 10kPa tension) and oven dryness. The volume change is reported in the table as percent change for the whole soil. Volume change is influenced by the amount and type of clay minerals in the soil.

Linear extensibility is used to determine the shrink-swell potential of soils. The shrink-swell potential is low if the soil has a linear extensibility of less than 3 percent; moderate if 3 to 6 percent; high if 6 to 9 percent; and very high if more than 9 percent. If the linear extensibility is more than 3, shrinking and swelling can cause damage to buildings, roads, and other structures and to plant roots. Special design commonly is needed.

Organic matter is the plant and animal residue in the soil at various stages of decomposition. In table 16, the estimated content of organic matter is expressed as a percentage, by weight, of the soil material that is less than 2 millimeters in diameter.

The content of organic matter in a soil can be maintained by returning crop residue to the soil. Organic matter has a positive effect on available water capacity, water infiltration, soil organism activity, and tilth. It is a source of nitrogen and other nutrients for crops and soil organisms.

Erosion Properties

Erosion factors are shown in table 17 as the K factor (Kw and Kf) and the T factor. Erosion factor K indicates the susceptibility of a soil to sheet and rill erosion by water. Factor K is one of several factors used in the Universal Soil Loss Equation (USLE) and the Revised Universal Soil Loss Equation (RUSLE) to predict the average annual rate of soil loss by sheet and rill erosion in tons per acre per year. The estimates are based primarily on percentage of silt, sand, and organic matter and on soil structure and permeability. Values of K range from 0.02 to 0.69. Other factors being equal, the higher the value, the more susceptible the soil is to sheet and rill erosion by water.

Depth to the upper and lower boundaries of each layer is indicated.

Erosion factor Kw indicates the erodibility of the whole soil. The estimates are modified by the presence of rock fragments.

Erosion factor Kf indicates the erodibility of the fine-earth fraction, or the material less than 2 millimeters in size.

Erosion factor T is an estimate of the maximum average annual rate of soil erosion by wind or water that can occur without affecting crop productivity over a sustained period. The rate is in tons per acre per year.

Wind erodibility groups are made up of soils that have similar properties affecting their susceptibility to wind erosion in cultivated areas. The soils assigned to group 1 are the most susceptible to wind erosion, and those assigned to group 8 are the least susceptible. A description of the wind erodibility groups is available in the National Soil Survey Handbook (<http://soils.usda.gov/technical/handbook/>).

Wind erodibility index is a numerical value indicating the susceptibility of soil to wind erosion, or the tons per acre per year that can be expected to be lost to wind erosion. There is a close correlation between wind erosion and the texture of the surface layer, the size and durability of surface clods, rock fragments, organic matter, and a calcareous reaction. Soil moisture and frozen soil layers also influence wind erosion.

Chemical Properties

Table 18 shows estimates of some chemical characteristics and features that affect soil behavior. These estimates are given for the layers of each soil in the survey area. The estimates are based on field observations and on test data for these and similar soils.

Depth to the upper and lower boundaries of each layer is indicated.

Clay as a soil separate consists of mineral soil particles that are less than 0.002 millimeter in diameter. In table 18, the estimated clay content of each soil layer is given as a percentage, by weight, of the soil material that is less than 2 millimeters in diameter.

The amount and kind of clay affect the fertility and physical condition of the soil and the ability of the soil to adsorb cations and to retain moisture. They influence shrink-swell potential, permeability, plasticity, the ease of soil dispersion, and other soil properties. The amount and kind of clay in a soil also affect tillage and earthmoving operations.

Cation-exchange capacity is the total amount of extractable bases that can be held by the soil, expressed in terms of milliequivalents per 100 grams of soil at neutrality (pH 7.0) or at some other stated pH value. Soils having a low cation-exchange capacity hold fewer cations and may require more frequent applications of fertilizer than soils having a high cation-exchange capacity. The ability to retain cations reduces the hazard of ground-water pollution.

Effective cation-exchange capacity refers to the sum of extractable bases plus aluminum expressed in terms of milliequivalents per 100 grams of soil. It is determined for soils that have pH of less than 5.5.

Soil reaction is a measure of acidity or alkalinity. The pH of each soil horizon is based on many field tests. For many soils, values have been verified by laboratory analyses. Soil reaction is important in selecting crops and other plants, in evaluating soil amendments for fertility and stabilization, and in determining the risk of corrosion.

Salinity is a measure of soluble salts in the soil at saturation. It is expressed as the electrical conductivity of the saturation extract, in millimhos per centimeter at 25 degrees C. Estimates are based on field and laboratory measurements at representative sites of nonirrigated soils. The salinity of irrigated soils is affected by the quality of the irrigation water and by the frequency of water application. Hence, the salinity of soils in individual fields can differ greatly from the value given in the table. Salinity affects the suitability of a soil for crop production, the stability of soil if used as construction material, and the potential of the soil to corrode metal and concrete.

Hydric Soils

In this section, hydric soils are defined and described and the hydric soils in the survey area are listed.

The three essential characteristics of wetlands are hydrophytic vegetation, hydric soils, and wetland hydrology (Cowardin and others, 1979; U.S. Army Corps of

Engineers, 1987; National Research Council, 1995; Tiner, 1985). Criteria for each of the characteristics must be met for areas to be identified as wetlands. Undrained hydric soils that have natural vegetation should support a dominant population of ecological wetland plant species. Hydric soils that have been converted to other uses should be capable of being restored to wetlands.

Hydric soils are defined by the National Technical Committee for Hydric Soils (NTCHS) as soils that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper part (Federal Register, 1994). These soils are either saturated or inundated long enough during the growing season to support the growth and reproduction of hydrophytic vegetation.

The NTCHS definition identifies general soil properties that are associated with wetness. In order to determine whether a specific soil is a hydric soil or nonhydric soil, however, more specific information, such as information about the depth and duration of the water table, is needed. Thus, criteria that identify those estimated soil properties unique to hydric soils have been established (Federal Register, 1995). These criteria are used to identify a phase of a soil series that normally is associated with wetlands. The criteria used are selected estimated soil properties that are described in "Soil Taxonomy" (Soil Survey Staff, 1999) and "Keys to Soil Taxonomy" (Soil Survey Staff, 2003) and in the "Soil Survey Manual" (Soil Survey Division Staff, 1993).

If soils are wet enough for a long enough period to be considered hydric, they should exhibit certain properties that can be easily observed in the field. These visible properties are indicators of hydric soils. The indicators used to make onsite determinations of hydric soils in this survey area are specified in "Field Indicators of Hydric Soils in the United States" (Hurt and others, 2004).

Hydric soils are identified by examining and describing the soil to a depth of about 20 inches. This depth may be greater if determination of an appropriate indicator so requires. It is always recommended that soils be excavated and described to the depth necessary for an understanding of the redoximorphic processes. Then, using the completed soil descriptions, soil scientists can compare the soil features required by each indicator and specify which indicators have been matched with the conditions observed in the soil. The soil can be identified as a hydric soil if at least one of the approved indicators is present.

The following map units meet the definition of hydric soils and, in addition, have at least one of the hydric soil indicators. This list can help in planning land uses; however, onsite investigation is recommended to determine the hydric soils on a specific site (National Research Council, 1995; Hurt and others, 2004).

- 102 Fluvents, 2 to 5 percent slopes
- 110 Weott, 0 to 2 percent slopes
- 116 Swainslough, 0 to 2 percent slopes
- 119 Arlynda, 0 to 2 percent slopes
- 126 Loleta, 2 to 5 percent slopes
- 155 Samoa-Clambeach-Dune land complex, 0 to 50 percent slopes (Clambeach component only)
- 171 Worswick-Arlynda, 0 to 2 percent slopes

Map units that are made up of hydric soils may have small areas, or inclusions, of nonhydric soils in the higher positions on the landform, and map units made up of nonhydric soils may have inclusions of hydric soils in the lower positions on the landform.

The following map units, in general, do not meet the definition of hydric soils because they do not have one of the hydric soil indicators. A portion of these map

Soil Survey of Redwood National and State Parks, California

units, however, may include hydric soils. Onsite investigation is recommended to determine whether hydric soils occur and the location of the included hydric soils.

100	Riverwash
157	Beaches-Samoa-Dune land complex, 0 to 50 percent slopes
172	Bigriver, 2 to 5 percent slopes
173	Bigriver-Ferndale-Russ complex, 2 to 5 percent slopes
174	Bigtree-Mystery complex, 2 to 9 percent slopes
177	Battery, dry, 15 to 50 percent slopes
178	Battery, 15 to 50 percent slopes
191	Talawa, 0 to 2 percent slopes
192	Aubell, 2 to 9 percent slopes
194	Tsunami, 2 to 9 percent slopes
220	Ferndale, 0 to 2 percent slopes
222	Ferndale, moderately well drained, 0 to 5 percent slopes

587	Childshill, 5 to 30 percent slopes
588	Surpur, dry, 2 to 15 percent slopes
590	Sasquatch-Yeti-Footstep complex, 5 to 30 percent slopes
591	Sasquatch-Sisterrocks-Ladybird complex, 30 to 50 percent slopes
592	Sisterrocks-Ladybird-Footstep complex, 50 to 75 percent slopes
593	Sasquatch-Yeti-Sisterrocks complex, 15 to 30 percent slopes
594	Sisterrocks-Sasquatch-Houda complex, 30 to 75 percent slopes
595	Battery-Catchings complex, 5 to 30 percent slopes
596	Flintrock-Highprairie complex, 15 to 75 percent slopes
597	Tarquin, 9 to 30 percent slopes
598	Ladybird-Stonehill complex, moist, 30 to 50 percent slopes
659	Raingage-Pigpen complex, 15 to 50 percent slopes
756	Oragan-Weitchpec complex, 30 to 50 percent slopes
759	Jayel-Walnett-Oragan complex, 30 to 75 percent slopes, extremely stony
760	Jayel-Walnett-Oragan complex, 9 to 30 percent slopes, extremely stony
761	Gasquet-Walnett-Jayel complex, 9 to 50 percent slopes, extremely stony

Soil Features

Table 19 gives estimates of various soil features. The estimates are used in land use planning that involves engineering considerations.

A *restrictive layer* is a nearly continuous layer that has one or more physical, chemical, or thermal properties that significantly impede the movement of water and air through the soil or that restrict roots or otherwise provide an unfavorable root environment. Examples are bedrock, cemented layers, dense layers, and frozen layers. The table indicates the hardness of the restrictive layer, which significantly affects the ease of excavation. *Depth to top* is the vertical distance from the soil surface to the upper boundary of the restrictive layer.

Potential for frost action is the likelihood of upward or lateral expansion of the soil caused by the formation of segregated ice lenses (frost heave) and the subsequent collapse of the soil and loss of strength on thawing. Frost action occurs when moisture moves into the freezing zone of the soil. Temperature, texture, density, permeability, content of organic matter, and depth to the water table are the most important factors considered in evaluating the potential for frost action. It is assumed that the soil is not insulated by vegetation or snow and is not artificially drained. Silty and highly structured, clayey soils that have a high water table in winter are the most susceptible to frost action. Well drained, very gravelly, or very sandy soils are the least susceptible. Frost heave and low soil strength during thawing cause damage to pavements and other rigid structures.

Risk of corrosion pertains to potential soil-induced electrochemical or chemical action that corrodes or weakens uncoated steel or concrete. The rate of corrosion of

uncoated steel is related to such factors as soil moisture, particle-size distribution, acidity, and electrical conductivity of the soil. The rate of corrosion of concrete is based mainly on the sulfate and sodium content, texture, moisture content, and acidity of the soil. Special site examination and design may be needed if the combination of factors results in a severe hazard of corrosion. The steel or concrete in installations that intersect soil boundaries or soil layers is more susceptible to corrosion than the steel or concrete in installations that are entirely within one kind of soil or within one soil layer.

For uncoated steel, the risk of corrosion, expressed as *low*, *moderate*, or *high*, is based on soil drainage class, total acidity, electrical resistivity near field capacity, and electrical conductivity of the saturation extract.

For concrete, the risk of corrosion also is expressed as *low*, *moderate*, or *high*. It is based on soil texture, acidity, and amount of sulfates in the saturation extract.

Water Features

Table 20 gives estimates of various water features. The estimates are used in land use planning that involves engineering considerations.

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The four hydrologic soil groups are:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas.

The *months* in the table indicate the portion of the year in which the feature is most likely to be a concern.

Water table refers to a saturated zone in the soil. Table 20 indicates, by month, depth to the top (*upper limit*) and base (*lower limit*) of the saturated zone in most years. Estimates of the upper and lower limits are based mainly on observations of the water table at selected sites and on evidence of a saturated zone, namely grayish colors or mottles (redoximorphic features) in the soil. A saturated zone that lasts for less than a month is not considered a water table.

Ponding is standing water in a closed depression. Unless a drainage system is installed, the water is removed only by percolation, transpiration, or evaporation. Table 20 indicates *surface water depth* and the *duration* and *frequency* of ponding. Duration is expressed as *very brief* if less than 2 days, *brief* if 2 to 7 days, *long* if 7 to 30 days, and *very long* if more than 30 days. Frequency is expressed as none, rare, occasional, and frequent. *None* means that ponding is not probable; *rare* that it is unlikely but

possible under unusual weather conditions (the chance of ponding is nearly 0 percent to 5 percent in any year); *occasional* that it occurs, on the average, once or less in 2 years (the chance of ponding is 5 to 50 percent in any year); and *frequent* that it occurs, on the average, more than once in 2 years (the chance of ponding is more than 50 percent in any year).

Flooding is the temporary inundation of an area caused by overflowing streams, by runoff from adjacent slopes, or by tides. Water standing for short periods after rainfall or snowmelt is not considered flooding, and water standing in swamps and marshes is considered ponding rather than flooding.

Duration and *frequency* are estimated. Duration is expressed as *extremely brief* if 0.1 hour to 4 hours, *very brief* if 4 hours to 2 days, *brief* if 2 to 7 days, *long* if 7 to 30 days, and *very long* if more than 30 days. Frequency is expressed as none, very rare, rare, occasional, frequent, and very frequent. *None* means that flooding is not probable; *very rare* that it is very unlikely but possible under extremely unusual weather conditions (the chance of flooding is less than 1 percent in any year); *rare* that it is unlikely but possible under unusual weather conditions (the chance of flooding is 1 to 5 percent in any year); *occasional* that it occurs infrequently under normal weather conditions (the chance of flooding is 5 to 50 percent in any year); *frequent* that it is likely to occur often under normal weather conditions (the chance of flooding is more than 50 percent in any year but is less than 50 percent in all months in any year); and *very frequent* that it is likely to occur very often under normal weather conditions (the chance of flooding is more than 50 percent in all months of any year).

The information is based on evidence in the soil profile, namely thin strata of gravel, sand, silt, or clay deposited by floodwater; irregular decrease in organic matter content with increasing depth; and little or no horizon development.

Also considered are local information about the extent and levels of flooding and the relation of each soil on the landscape to historic floods. Information on the extent of flooding based on soil data is less specific than that provided by detailed engineering surveys that delineate flood-prone areas at specific flood frequency levels.

Selected Soil and Site Features

Table 21 provides information about the climate and geomorphology for the map units in the survey area. It also lists the ecological sites.

MAP stands for mean annual precipitation, which is the average of the total annual liquid precipitation over the latest standard “normal” period of 30 years.

Landscape is a group of spatially related, natural landforms over a relatively large area. The landscape is the land surface that the eye can comprehend in a single view.

Landform is any physical, recognizable form or feature on the earth's surface having a characteristic shape and range in composition and produced by natural causes. A landform can span a wide range in size.

Parent material is the unconsolidated and more or less chemically weathered mineral or organic matter from which a soil forms.

An *ecological site* is an area where climate, soil, and relief are sufficiently uniform to produce a distinct natural plant community.

Classification of the Soils

The system of soil classification used by the National Cooperative Soil Survey has six categories (Soil Survey Staff, 1999 and 2004). Beginning with the broadest, these categories are the order, suborder, great group, subgroup, family, and series. Classification is based on soil properties observed in the field or inferred from those observations or from laboratory measurements. Table 22 shows the classification of the soils in the survey area. The categories are defined in the following paragraphs.

ORDER. Twelve soil orders are recognized. The differences among orders reflect the dominant soil-forming processes and the degree of soil formation. Each order is identified by a word ending in *sol*. An example is Ultisol (*Ult*, meaning, last).

SUBORDER. Each order is divided into suborders primarily on the basis of properties that influence soil genesis and are important to plant growth or properties that reflect the most important variables within the orders. The last syllable in the name of a suborder indicates the order. An example is Humult (*Hum*, meaning presence of organic matter, plus *Ult*, from Ultisol).

GREAT GROUP. Each suborder is divided into great groups on the basis of close similarities in kind, arrangement, and degree of development of pedogenic horizons; soil moisture and temperature regimes; type of saturation; and base status. Each great group is identified by the name of a suborder and by a prefix that indicates a property of the soil. An example is Palehumults (*Pale*, meaning old, excessive development, plus *humult*, the suborder of the Ultisols that has organic matter in the subsurface).

SUBGROUP. Each great group has a typic subgroup. Other subgroups are intergrades or extragrades. The typic subgroup is the central concept of the great group; it is not necessarily the most extensive. Intergrades are transitions to other orders, suborders, or great groups. Extragrades have some properties that are not representative of the great group but do not indicate transitions to any other taxonomic class. Each subgroup is identified by one or more adjectives preceding the name of the great group. The adjective *Typic* identifies the subgroup that typifies the great group. An example is Typic Palehumults.

FAMILY. Families are established within a subgroup on the basis of physical and chemical properties and other characteristics that affect management. Generally, the properties are those of horizons below plow depth where there is much biological activity. Among the properties and characteristics considered are particle-size class, mineralogy class, cation-exchange activity class, soil temperature regime, soil depth, and reaction class. A family name consists of the name of a subgroup preceded by terms that indicate soil properties. An example is fine-loamy, mixed, semiactive, isomesic Typic Palehumults.

SERIES. The series consists of soils within a family that have horizons similar in color, texture, structure, reaction, consistence, mineral and chemical composition, and arrangement in the profile. An example is the Coppercreek series. The soils of the Coppercreek series are fine-loamy, mixed, semiactive, isomesic Typic Palehumults.

Soil Series and Their Morphology

In this section, each soil series recognized in the survey area is described. Characteristics of the soil and the material in which it formed are identified for each series. A pedon, a small three-dimensional area of soil, that is typical of the series in the survey area is described. The detailed description of each soil horizon follows standards in the "Soil Survey Manual" (Soil Survey Division Staff, 1993). Many of the technical terms used in the descriptions are defined in "Soil Taxonomy" (Soil Survey Staff, 1999) and in "Keys to Soil Taxonomy" (Soil Survey Staff, 2003). Unless otherwise indicated, colors in the descriptions are for moist soil if the soil is udic or ustic and for dry soils if the soil is xeric. Following the pedon description is the range of important characteristics of the soils in the series.

Ahpah Series

Setting

Landscape position: Ridges and convex mountain slopes
Parent material: Residuum and colluvium derived from schist and sandstone
Slope: 15 to 50 percent
Elevation: 60 to 3,035 feet (19 to 926 meters)
Depth class: Moderately deep
Drainage class: Well drained
Slowest saturated hydraulic conductivity: Moderately high
Slowest permeability: Moderately slow or moderate
Mean annual precipitation: 75 to 100 inches (1,900 to 2,550 millimeters)
Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)
Frost-free season: 220 to 290 days
Taxonomic classification: Fine-loamy, mixed, active, isomesic Typic Dystrudepts

Modal Pedon

Ahpah gravelly clay loam, in an area of Coppercreek-Ahpah-Lacks creek complex, 30 to 50 percent slopes, on a convex, northeast-facing slope of 32 percent, under redwood, Pacific rhododendron, and California huckleberry, at an elevation of 1,558 feet (475 meters); in Redwood National Park, Humboldt County, California; USGS Rodger's Peak quadrangle; UTM zone 10, 411639mE, 4558856mN, NAD83.

- Oi—0 to 2 inches (0 to 5 centimeters); fresh and slightly decomposed tanoak leaves, conifer needles, and twigs.
- A—2 to 9 inches (5 to 22 centimeters); brown (7.5YR 4/4) gravelly clay loam, brownish yellow (10YR 6/6) dry; weak fine subangular blocky structure; slightly hard, friable, moderately sticky and slightly plastic; common very fine, fine, and medium roots; few very fine irregular and common very fine and fine tubular pores; 18 percent gravel; moderately acid (pH 6.0); clear wavy boundary.
- Bw1—9 to 21 inches (22 to 53 centimeters); yellowish brown (10YR 5/6) gravelly silty clay loam, yellow (10YR 7/6) dry; weak fine and medium subangular blocky structure; soft, friable, moderately sticky and slightly plastic; common very fine, fine, and medium and few coarse roots; common very fine and fine and few medium tubular pores; 19 percent gravel; strongly acid (pH 5.5); gradual wavy boundary.
- Bw2—21 to 28 inches (53 to 70 centimeters); yellowish brown (10YR 5/6) gravelly clay loam, yellow (10YR 7/6) dry; weak medium subangular blocky structure; slightly hard, friable, moderately sticky and slightly plastic; few very fine, fine, and coarse and common medium roots; few very fine and fine tubular pores; 15- by 30-centimeter krotovina filled with yellowish red (5YR 5/6) clay loam, reddish yellow (5YR 6/6) dry; 21 percent gravel; strongly acid (pH 5.5); clear irregular boundary.

C—28 to 34 inches (70 to 87 centimeters); variegated olive gray (5Y 5/2) and yellowish brown (10YR 5/6) very gravelly loam, light gray (2.5Y 7/2) dry; massive; slightly hard, friable, slightly sticky and slightly plastic; few very fine, fine, and medium roots; few very fine and fine tubular pores; 42 percent gravel, consisting mostly of bedrock fractured in place; strongly acid (pH 5.5); clear wavy boundary.

Cr—34 to 45 inches (87 to 115 centimeters); highly weathered schist saprolite, easily cut with a knife; schist foliation and rock macrostructure still evident; contains pockets of hard (lithic) rock, amounting to approximately 5 percent of the area exposed.

Range in Characteristics

Depth to soft bedrock: 20 to 40 inches (50 to 100 centimeters)

Control section (by weighted average): 20 to 32 percent clay, 15 to 30 percent gravel, and 0 to 5 percent cobbles

Water table: None noted

Reaction: Moderately acid or strongly acid

O horizon (where present)

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Strongly acid or very strongly acid

A horizon

Hue: 7.5YR or 10YR

Value: 5 or 6 dry, 3 to 5 moist

Chroma: 2 to 6 dry or moist

Texture of the fine-earth fraction: Loam or clay loam

Content of clay: 20 to 30 percent

Rock fragments: 15 to 25 percent gravel and 0 to 10 percent cobbles

Bw horizon

Hue: 7.5YR, 10YR, or 2.5Y

Value: 5 to 7 dry, 3 to 5 moist

Chroma: 4 to 6 dry or moist

Texture of the fine-earth fraction: Sandy clay loam, loam, clay loam, or silty clay loam

Content of clay: 20 to 32 percent

Rock fragments: 15 to 30 percent gravel and 0 to 5 percent cobbles

C horizon

Hue: 7.5YR, 10YR, 2.5Y, or 5Y

Value: 5 to 7 dry, 3 to 6 moist

Chroma: 2 to 6 dry or moist

Texture of the fine-earth fraction: Sandy clay loam, loam, clay loam, or silty clay loam

Content of clay: 20 to 27 percent

Rock fragments: 35 to 50 percent gravel and 0 to 5 percent cobbles

Airstrip Series

Setting

Landscape position: Strongly convex ridgetops, spur ridges, and mountain slopes

Parent material: Residuum and colluvium derived from sandstone and siltstone

Slope: 9 to 50 percent

Elevation: 500 to 3,385 feet (153 to 1,032 meters)

Soil Survey of Redwood National and State Parks, California

Depth class: Moderately deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderate

Mean annual precipitation: 85 to 100 inches (2,160 to 2,550 millimeters)

Mean annual temperature: 50 to 59 degrees F (10 to 15 degrees C)

Frost-free season: 200 to 280 days

Taxonomic classification: Loamy-skeletal, mixed, superactive, mesic Humic
Dystrocherepts

Modal Pedon

Airstrip gravelly loam, in an area of Dolason-Countshill-Airstrip complex, 9 to 30 percent slopes, on a convex, southwest-facing slope of 9 percent, under western brackenfern and velvetgrass, at an elevation of 2,985 feet (910 meters); on Trail Ridge, in Trail Ridge Prairie, Humboldt County, California; USGS Hupa Mountain quadrangle; UTM zone 10, 428469mE, 4551271mN, NAD83.

- A1—0 to 3 inches (0 to 7 centimeters); dark grayish brown (10YR 4/2) gravelly loam, very dark brown (10YR 2/2) moist; weak fine and medium and granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine and common fine roots; common very fine and fine interstitial and very fine and fine tubular pores; 15 percent gravel; very strongly acid (pH 5.0); clear wavy boundary.
- A2—3 to 8 inches (7 to 20 centimeters); dark grayish brown (10YR 4/2) gravelly loam, very dark brown (10YR 2/2) moist; moderate fine and medium granular structure; soft, very friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine and fine interstitial and very fine and fine tubular pores; 15 percent gravel; very strongly acid (pH 5.0); gradual wavy boundary.
- A3—8 to 17 inches (20 to 42 centimeters); dark grayish brown (10YR 4/2) loam, very dark brown (10YR 2/2) moist; weak medium and coarse subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and fine and few medium roots; common very fine and fine and few medium tubular pores; 10 percent gravel; strongly acid (pH 5.2); clear wavy boundary.
- AC—17 to 26 inches (42 to 67 centimeters); brown (10YR 5/3) extremely gravelly loam, dark brown (10YR 3/3) moist; weak fine and medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and fine and few medium and coarse roots; common very fine and fine interstitial pores; 45 percent gravel and 15 percent cobbles; strongly acid (pH 5.4); gradual wavy boundary.
- R—26 inches (67 centimeters); fractured sandstone, fractures are greater than 10 centimeters apart.

Range in Characteristics

Depth to hard bedrock: 20 to 40 inches (50 to 100 centimeters)

Control section (by weighted average): 12 to 26 percent clay, 35 to 60 percent gravel, and 0 to 25 percent cobbles

Water table: None noted

Surface fragments: 15 to 35 percent gravel and 0 to 5 percent cobbles

A horizon

Hue: 10YR or 2.5Y

Value: 4 or 5 dry, 2 or 3 moist

Chroma: 1 to 3 dry or moist

Texture of the fine-earth fraction: Loam

Content of clay: 12 to 24 percent

Rock fragments: 10 to 25 percent gravel and 0 to 10 percent cobbles

Reaction: Strongly acid or very strongly acid

Bw horizon (where present)

Hue: 10YR or 2.5Y

Value: 5 to 7 dry, 3 to 5 moist

Chroma: 3 or 4 dry, 3 moist

Texture of the fine-earth fraction: Loam

Content of clay: 20 to 26 percent

Rock fragments: 35 to 60 percent gravel and 0 to 25 percent cobbles

Reaction: Strongly acid or very strongly acid

C horizon (where present)

Hue: 2.5Y

Value: 5 to 7 dry, 3 to 5 moist

Chroma: 2 to 4 dry or moist

Texture of the fine-earth fraction: Loam

Content of clay: 20 to 26 percent

Rock fragments: 35 to 60 percent gravel and 0 to 25 percent cobbles

Reaction: Strongly acid or very strongly acid

The Airstrip soils in map unit 481 are taxadjuncts to the series. These soils have an isomesic soil temperature regime and a udic soil moisture regime. Also, in some pedons they have an Oi horizon. These differences, however, do not affect use and management.

Arlynda Series

Setting

Landscape position: Backswamps, depressions, meander scars, and low flood-plain steps

Parent material: Alluvium derived from mixed sources

Slope: 0 to 2 percent

Elevation: 0 to 160 feet (0 to 50 meters)

Depth class: Very deep

Drainage class: Very poorly drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderately slow

Flooding: Occasional

Ponding: Frequent

Mean annual precipitation: 35 to 80 inches (890 to 2,030 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 275 to 330 days

Taxonomic classification: Fine-silty, mixed, superactive, nonacid, isomesic
Fluvaqueptic Endoaquepts

Modal Pedon

Arlynda peat, in an area of Arlynda, 0 to 2 percent slopes, on a slope of 1 percent, under pasture grasses, ryegrass, barley, and buttercup, at an elevation of 3 feet (1 meter); Humboldt County, California; USGS Cannibal Island quadrangle; UTM zone 10, 392976mE, 4502447mN, NAD83.

Oi—0 to 3 inches (0 to 8 centimeters); very dark gray (10YR 3/1) peat, very dark grayish brown (10YR 3/2) dry and rubbed; 80 percent fiber unrubbed, 50 percent rubbed; moderately acid (pH 5.6); massive; hard, firm, slightly sticky and slightly plastic; many fine prominent dark yellowish brown (10YR 4/6) iron-manganese masses; neutral (pH 6.8); clear smooth boundary.

A—3 to 14 inches (8 to 36 centimeters); dark gray (2.5Y 4/1) silty clay loam, gray (2.5Y 6/1) dry; moderate coarse subangular blocky structure; hard, firm, slightly

sticky and slightly plastic; many very fine and fine roots; common very fine and fine tubular pores; many medium prominent dark yellowish brown (10YR 4/6) iron-manganese masses; neutral (pH 6.8); gradual wavy boundary.

Bg1—14 to 22 inches (36 to 56 centimeters); dark gray (2.5Y 4/1) silty clay loam, gray (2.5Y 6/1) dry; moderate fine subangular blocky structure; hard, firm, slightly sticky and slightly plastic; many very fine and common fine roots; many very fine and fine tubular pores; many medium prominent dark yellowish brown (10YR 4/6) iron-manganese masses; neutral (pH 6.8); gradual wavy boundary.

Bg2—22 to 41 inches (56 to 104 centimeters); dark gray (2.5Y 4/1) silty clay loam, gray (2.5Y 6/1) dry; massive; hard, firm, slightly sticky and slightly plastic; few very fine roots; few very fine tubular pores; many medium prominent dark yellowish brown (10YR 4/6) iron-manganese masses; common prominent strong brown (7.5YR 4/6) iron stains lining root channels and/or pores; slightly acid (pH 6.2); gradual wavy boundary.

Bg3—41 to 63 inches (104 to 160 centimeters); dark gray (5Y 4/1) silty clay loam, gray (5Y 6/1) dry; massive; hard, firm, slightly sticky and slightly plastic; few very fine roots; few very fine tubular pores; many medium prominent strong brown (7.5YR 4/6) masses of iron accumulation; common prominent strong brown (7.5YR 4/6) iron stains lining root channels and/or pores; few medium prominent strong brown (7.5YR 4/6) cylindrical very weakly cemented iron-manganese concretions; neutral (pH 6.8).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 25 to 34 percent clay

Water table: At a depth of 0 to 4 inches (0 to 10 centimeters) December through April, 6 to 35 inches (15 to 90 centimeters) in May, 12 to 35 inches (5 to 90 centimeters) June through July, 35 to greater than 72 inches (90 to greater than 182 centimeters) August through November

O horizon

Hue: 10YR

Value: 3 or 4 dry or moist

Chroma: 1 or 2 dry or moist

Kind of organic material: Peat

Reaction: Neutral

A horizon

Hue: 10YR, 2.5Y, or 5Y

Value: 5 to 7 dry, 3 or 4 moist

Chroma: 1 or 2 dry or moist

Texture of the fine-earth fraction: Silt loam or silty clay loam

Content of clay: 25 to 34 percent

Reaction: Slightly acid or neutral

Redoximorphic features:

Type—fine and medium iron-manganese masses in the matrix; iron stains lining root channels and/or pores

Quantity—common or many

Hue—2.5YR, 5YR, 7.5YR, or 10YR

Value—3 to 6

Chroma—6 to 8

Upper part of the Bg horizon

Hue: 2.5Y or 5Y

Value: 5 to 7 dry, 4 or 5 moist

Chroma: 1 or 2 dry or moist

Texture of the fine-earth fraction: Silt loam or silty clay loam

Content of clay: 25 to 34 percent

Reaction: Slightly acid to slightly alkaline

Redoximorphic features:

Type—fine and medium iron-manganese masses in the matrix; iron stains lining root channels and/or pores

Quantity—common or many

Hue—2.5YR, 5YR, 7.5YR, or 10YR

Value—3 to 6

Chroma—4 to 8

Lower part of the Bg horizon

Hue: 2.5Y, 5Y, or neutral

Value: 5 to 7 dry, 4 or 5 moist

Chroma: Neutral or 1 dry or moist

Texture of the fine-earth fraction: Silt loam, clay loam, or silty clay loam

Content of clay: 21 to 39 percent

Reaction: Slightly acid to slightly alkaline

Redoximorphic features:

Type—fine and medium iron-manganese masses in the matrix; iron stains lining root channels and/or pores; few medium cylindrical very weakly cemented iron-manganese concretions

Quantity—few to many

Hue—2.5YR, 5YR, 7.5YR, or 10YR

Value—3 to 6

Chroma—4 to 8

The Arlynda soils in map unit 171 are taxadjuncts to the series. These soils are fine-loamy in the particle-size control section. This difference, however, does not affect use and management.

Atwell Series

Setting

Landscape position: Steep, wet, irregular mountain slopes

Parent material: Earthflow colluvium derived from sheared sandstone and mudstone (fig. 15)

Slope: 30 to 50 percent

Elevation: 55 to 2,870 feet (18 to 874 meters)

Depth class: Very deep

Drainage class: Moderately well drained

Slowest saturated hydraulic conductivity: Low

Slowest permeability: Very slow

Mean annual precipitation: 70 to 90 inches (1,780 to 2,290 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 250 to 290 days

Taxonomic classification: Fine, mixed, active, isomesic Oxyaquic Hapludalfs

Modal Pedon

Atwell silt loam, in an area of Atwell-Ladybird complex, 30 to 50 percent slopes, on a southwest-facing slope of 30 percent, under redwood, Douglas-fir, tanoak, western hemlock, grand fir, rhododendron, huckleberry, Cascade barberry, salal, swordfern, deer fern, and redwood-sorrel, at an elevation of 699 feet (213 meters); in Redwood National Park, Humboldt County, California; USGS Bald Hills quadrangle; UTM zone 10, 416420mE, 4564884mN, NAD83.

Figure 15.—A profile of an Atwell soil. These soils form in earthflow deposits on unstable mountain slopes. Depth is marked in centimeters.

Soil Survey of Redwood National and State Parks, California

- Oi—0 to 2 inches (0 to 5 centimeters); slightly decomposed needles, leaves, and twigs; clear wavy boundary.
- A—2 to 7 inches (5 to 17 centimeters); brown (10YR 3/3) silt loam, grayish brown (10YR 5/2) dry; moderate medium granular and moderate very fine subangular blocky structure; hard, firm, slightly sticky and slightly plastic; many very fine and fine and common medium roots; many fine irregular pores; about 10 percent gravel; slightly acid (pH 6.5); clear wavy boundary.
- AB—7 to 11 inches (17 to 29 centimeters); dark brown (10YR 4/3) clay loam, brown (10YR 5/3) dry; moderate medium subangular blocky structure; hard, firm, moderately sticky and slightly plastic; common very fine, fine, and medium and few coarse roots; common very fine tubular and common fine irregular pores; about 10 percent gravel; moderately acid (pH 6.0); clear wavy boundary.
- ABt—11 to 23 inches (29 to 59 centimeters); yellowish brown (10YR 4/4) clay loam, dark yellowish brown (10YR 5/4) dry; moderate coarse subangular blocky structure parting to moderate medium subangular blocky; hard, firm, moderately sticky and moderately plastic; common very fine, fine, and coarse and many medium roots; few fine irregular and common very fine, fine, and medium tubular pores; common faint clay films on faces of peds; about 10 percent gravel; moderately acid (pH 6.0); clear irregular boundary.
- Bt—23 to 32 inches (59 to 81 centimeters); light olive brown (2.5Y 5/4) gravelly clay loam, pale yellow (2.5Y 7/4) dry; moderate medium subangular blocky structure; hard, firm, moderately sticky and very plastic; common very fine and fine roots; few very fine and fine tubular pores; few distinct clay films on faces of peds; about 30 percent gravel; moderately acid (pH 6.0); clear wavy boundary.
- 2Cg1—32 to 41 inches (81 to 103 centimeters); greenish gray (5GY 5/1) clay, light gray (N 7/0) dry; massive; very hard, very firm, moderately sticky and very plastic; few very fine and fine roots; few very fine and fine tubular pores; many medium prominent reddish yellow (7.5YR 6/6) masses of iron accumulation, strong brown (7.5YR 5/6) moist; about 10 percent gravel; moderately acid (pH 6.0); clear smooth boundary.
- 2Cg2—41 to 61 inches (103 to 155 centimeters); dark bluish gray (5B 4/1) clay, gray (N 6/0) dry; massive; very hard, very firm, moderately sticky and very plastic; few very fine and fine roots; few very fine and fine tubular pores; common fine prominent brown (10YR 5/4) masses of iron accumulation, brownish yellow (10YR 6/6) dry; about 10 percent gravel; slightly acid (pH 6.5); diffuse smooth boundary.
- 2Cg3—61 to 81 inches (155 to 205 centimeters); black (5Y 2.5/1) clay, gray (N 5/0) dry; massive; very hard, very firm, moderately sticky and very plastic; few very fine and fine roots; few very fine and fine tubular pores; common prominent brown (10YR 5/4) masses of iron accumulation, brownish yellow (10YR 6/6) dry; about 10 percent gravel; many slickensides; slightly acid (pH 6.5).

Range in Characteristics

Depth to soft bedrock: Greater than 80 inches (200 centimeters)

Control section (by weighted average): 35 to 50 percent clay and 5 to 30 percent gravel

Water table: At a depth of 32 to 40 inches (81 to 100 centimeters)

Surface fragments: 3 to 15 percent gravel

O horizon (where present)

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 10YR

Value: 5 or 6 dry, 3 or 4 moist

Chroma: 2 or 3 dry or moist

Texture of the fine-earth fraction: Silt loam

Content of clay: 23 to 27 percent

Rock fragments: 3 to 13 percent gravel

Reaction: Moderately acid or strongly acid

Bt horizon

Hue: 10YR or 2.5Y

Value: 6 or 7 dry, 4 or 5 moist

Chroma: 3 or 4 dry or moist

Texture of the fine-earth fraction: Clay loam or clay

Content of clay: 30 to 50 percent

Rock fragments: 3 to 30 percent gravel

Reaction: Moderately acid or strongly acid

Redoximorphic features:

Type—fine and medium iron-manganese masses in the matrix; iron stains lining root channels and/or pores

Quantity—common or many

Hue—7.5YR or 10YR

Value—4 to 6

Chroma—6 to 8

Cg horizon

Hue: 5Y, 2.5Y, neutral, 5GY, or 5B

Value: 5 to 7 dry, 2 to 6 moist

Chroma: Neutral to 2 dry or moist

Texture of the fine-earth fraction: Clay loam, clay, or silty clay

Content of clay: 35 to 50 percent

Rock fragments: 3 to 30 percent gravel

Reaction: Neutral to moderately acid

Redoximorphic features:

Type—fine and medium iron-manganese masses in the matrix; iron stains lining root channels and/or pores

Quantity—common or many

Hue—7.5YR or 10YR

Value—4 to 6

Chroma—6 to 8

Aubell Series

Setting

Landscape position: Dissected fan remnants

Parent material: Alluvium derived from mixed sources

Slope: 2 to 9 percent

Elevation: 65 to 140 feet (21 to 43 meters)

Depth class: Very deep

Drainage class: Somewhat poorly drained

Slowest saturated hydraulic conductivity: Moderately low to moderately high

Slowest permeability: Moderately slow or slow

Mean annual precipitation: 60 to 80 inches (1,520 to 2,030 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 275 to 330 days

Taxonomic classification: Fine, mixed, active, mesic Oxyaquic Dystrudepts

Modal Pedon

Aubell clay loam, in an area of Aubell, 2 to 9 percent slopes, on a slightly convex, south-facing slope of 4 percent, under sweet vernalgrass, velvetgrass, orchardgrass, small Douglas-fir, and cascara, at an elevation of 98 feet (30 meters); in Jedediah Smith Redwoods State Park, Del Norte County, California; east of Aubell Road at the North Operations Center; USGS Crescent City quadrangle; UTM zone 10, 404762mE, 4624753mN, NAD83.

- Ap1—0 to 4 inches (0 to 10 centimeters); very dark gray (2.5Y 3/1) clay loam, dark grayish brown (2.5Y 4/2) dry; moderate very fine and fine subangular blocky and moderate medium granular structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and common fine roots; many very fine and common fine tubular and common very fine, fine, and medium irregular pores; 1 percent gravel; strongly acid (pH 5.4); clear smooth boundary.
- Ap2—4 to 10 inches (10 to 26 centimeters); very dark gray (2.5Y 3/1) clay loam, dark grayish brown (2.5Y 4/2) dry; strong very fine and weak fine subangular blocky and moderate medium granular structure; slightly hard, friable, moderately sticky and moderately plastic; many very fine and common fine roots; many very fine and common fine tubular and common very fine and fine irregular pores; 1 percent gravel; strongly acid (pH 5.4); clear smooth boundary.
- Bw1—10 to 16 inches (26 to 41 centimeters); light olive brown (2.5Y 5/4) clay loam, pale yellow (2.5Y 7/4) dry; moderate fine subangular blocky structure; moderately hard, firm, moderately sticky and very plastic; common very fine and fine roots; common very fine and fine tubular and common very fine irregular pores; few fine prominent strong brown (7.5YR 5/8) masses of iron accumulation in the matrix; 3 percent gravel; strongly acid (pH 5.2); clear smooth boundary.
- Bw2—16 to 23 inches (41 to 58 centimeters); light olive brown (2.5Y 5/4) clay loam, light yellowish brown (2.5Y 6/3) dry; moderate fine and medium subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; common very fine and fine roots; common very fine tubular and common very fine irregular pores; common fine prominent strong brown (7.5YR 5/8) masses of iron accumulation in the matrix; 3 percent gravel; strongly acid (pH 5.2); clear smooth boundary.
- Bw3—23 to 27 inches (58 to 69 centimeters); light olive brown (2.5Y 5/4) clay loam, pale yellow (2.5Y 7/3) dry; weak medium and coarse subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; common very fine and fine roots; common very fine tubular and common very fine irregular pores; common fine prominent strong brown (7.5YR 5/8) masses of iron accumulation in the matrix; few fine prominent black (N 2.5/0) masses of manganese accumulations in the matrix; 3 percent gravel; very strongly acid (pH 5.0); clear smooth boundary.
- C1—27 to 39 inches (69 to 100 centimeters); light olive brown (2.5Y 5/3) silty clay loam, pale yellow (2.5Y 7/3) dry; massive; moderately hard, firm, moderately sticky and very plastic; moderately few very fine roots; common very fine tubular and irregular pores; many fine and medium prominent strong brown (7.5YR 5/8) masses of iron accumulation in the matrix; many fine and medium distinct light brownish gray (2.5Y 6/2) iron depletions in the matrix; 3 percent gravel and 1 percent paragravel; very strongly acid (pH 5.0); clear wavy boundary.
- C2—39 to 60 inches (100 to 152 centimeters); light olive brown (2.5Y 5/3) very gravelly clay loam, pale yellow (2.5Y 7/3) dry; massive; slightly hard, friable, moderately sticky and moderately plastic; common very fine irregular pores; common fine prominent strong brown (7.5YR 5/6) masses of iron accumulation in the matrix; common fine distinct light brownish gray (2.5Y 6/2) iron depletions in the matrix; 50 percent gravel; very strongly acid (pH 5.0).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 35 to 40 percent clay and 0 to 7 percent gravel

Water table: At a depth of 26 to 100 centimeters (10 to 39 inches)

A or Ap horizon

Hue: 10YR or 2.5Y

Value: 3 to 5 dry, 2 or 3 moist

Chroma: 1 to 3 dry or moist

Texture of the fine-earth fraction: Clay loam

Rock fragments: 0 to 7 percent gravel

Content of clay: 27 to 30 percent

Reaction: Strongly acid

Bw horizon

Hue: 10YR or 2.5Y

Value: 5 to 7 dry, 3 to 6 moist

Chroma: 2 to 4 dry or moist

Texture of the fine-earth fraction: Clay loam

Rock fragments: 0 to 7 percent gravel

Content of clay: 35 to 40 percent

Reaction: Strongly acid

Redoximorphic features:

Type—masses of iron and manganese and iron depletions

Quantity—few to many

Hue—7.5YR, 10YR, 2.5Y, or neutral

Value—2.5 to 5 moist

Chroma—neutral to 8 moist

C horizon

Hue: 10YR or 2.5Y

Value: 5 to 7 dry, 4 to 6 moist

Chroma: 2 to 4 dry or moist

Texture of the fine-earth fraction: Silty clay loam, clay loam, or clay

Rock fragments: 0 to 60 percent gravel

Content of clay: 30 to 45 percent

Reaction: Moderately acid to very strongly acid

Redoximorphic features:

Type—masses of iron and manganese and iron depletions

Quantity—few to many

Hue—7.5YR, 10YR, 2.5Y, or neutral

Value—2.5 to 5 moist

Chroma—neutral to 8 moist

Battery Series

Setting

Landscape position: Uplifted, dissected stream terraces and remnants

Parent material: Alluvium derived from mixed sources

Slope: 5 to 50 percent

Elevation: 55 to 915 feet (17 to 280 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderately slow

Soil Survey of Redwood National and State Parks, California

Mean annual precipitation: 65 to 90 inches (1,650 to 2,290 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 240 to 300 days

Taxonomic classification: Fine-loamy, mixed, semiactive, isomesic Typic Palehumults

Modal Pedon

Battery gravelly clay loam, in an area of Battery-Catchings complex, 5 to 30 percent slopes, on a convex, north-facing slope of 25 percent, under redwood, Douglas-fir, tanoak, red alder, Pacific rhododendron, California huckleberry, and swordfern, at an elevation of 340 feet (104 meters); in Jedediah Smith Redwoods State Park, Del Norte County, California; USGS Hiouchi quadrangle; UTM zone 10, 406883mE, 4629294mN, NAD83.

A1—0 to 7 inches (0 to 19 centimeters); dark brown (10YR 3/3) gravelly clay loam, pale brown (10YR 6/3) dry; weak very fine and fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine, and medium roots; common very fine and fine tubular and irregular pores; 20 percent gravel; strongly acid (pH 5.2); clear wavy boundary.

A2—7 to 13 inches (19 to 32 centimeters); dark brown (10YR 3/3) gravelly clay loam, yellowish brown (10YR 5/4) dry; moderate very fine and weak fine subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; common very fine, fine, medium, coarse, and very coarse roots; common very fine, fine, and coarse tubular and common very fine and fine irregular pores; 15 percent gravel; strongly acid (pH 5.4); clear wavy boundary.

Bt1—13 to 25 inches (32 to 64 centimeters); brown (7.5YR 4/4) gravelly clay loam, light brown (7.5YR 6/4) dry; moderate medium and weak fine subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; moderately few very fine and common fine and medium roots; common very fine and fine irregular pores; few distinct clay films on faces of peds and on rock fragments; 25 percent gravel; strongly acid (pH 5.4); abrupt wavy boundary.

Bt2—25 to 39 inches (64 to 100 centimeters); yellowish brown (10YR 5/6) gravelly clay loam, yellow (10YR 7/6) dry; weak fine and medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; common very fine, fine, and medium roots; common very fine, fine, and medium irregular pores; few distinct clay films on faces of peds and on rock fragments; 20 percent gravel; very strongly acid (pH 5.0); clear wavy boundary.

Bt3—39 to 54 inches (100 to 138 centimeters); strong brown (7.5YR 5/6) gravelly clay loam, yellow (10YR 7/6) dry; weak fine and medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; moderately few fine and common very fine, medium, and very coarse roots; common fine tubular and common very fine and fine irregular pores; few distinct clay films on faces of peds and on rock fragments; 20 percent gravel; very strongly acid (pH 5.0); clear wavy boundary.

Bt4—54 to 70 inches (138 to 179 centimeters); strong brown (7.5YR 5/6) gravelly clay loam, yellow (10YR 7/6) dry; weak fine and medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; common very fine, fine, medium, and very coarse roots; common very fine and fine tubular and irregular pores; few distinct clay films on faces of peds and on rock fragments; 20 percent gravel and 5 percent paragravel; very strongly acid (pH 5.0); abrupt wavy boundary.

2C—70 to 79 inches (179 to 200 centimeters); 70 percent light olive brown (2.5Y 5/3) and 30 percent strong brown (7.5YR 5/8) paragravelly clay loam, light gray (2.5Y 7/2) and reddish yellow (7.5YR 6/8) dry; massive; moderately hard, firm, moderately sticky and moderately plastic; common very fine and fine roots;

moderately few very fine and fine irregular pores; 10 percent gravel and 10 percent paragravel; very strongly acid (pH 5.0).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 27 to 35 percent clay, 15 to 30 percent gravel, 0 to 10 percent paragravel, and 0 to 10 percent cobbles

Water table: None noted

Reaction: Strongly acid or very strongly acid

A horizon

Hue: 7.5YR or 10YR

Value: 4 to 7 dry, 3 or 4 moist

Chroma: 2 to 4 dry or moist

Texture of the fine-earth fraction: Loam or clay loam

Content of clay: 20 to 33 percent

Rock fragments: 15 to 35 percent gravel and 0 to 5 percent cobbles

Bt horizon

Hue: 7.5YR, 10YR, or 2.5Y

Value: 4 to 7 dry, 2 to 6 moist

Chroma: 2 to 6 dry, 3 to 8 moist

Texture of the fine-earth fraction: Clay loam

Content of clay: 27 to 35 percent

Rock fragments: 15 to 30 percent gravel, 0 to 10 percent paragravel, and 0 to 10 percent cobbles

C horizon

Hue: 7.5YR, 10YR, or 2.5Y

Value: 6 to 8 dry, 4 to 6 moist

Chroma: 2 to 8 dry, 3 to 8 moist

Texture of the fine-earth fraction: Clay loam

Content of clay: 27 to 35 percent

Rock fragments: 0 to 40 percent gravel, 0 to 25 percent paragravel, and 0 to 10 percent cobbles

The Battery soils in map unit 177 are taxadjuncts to the series. These soils have an ustic soil moisture regime. This difference, however, does not affect use and management.

Bigriver Series

Setting

Landscape position: Lower alluvial flats; flood plains

Parent material: Alluvium derived from mixed sources (fig. 16)

Slope: 2 to 5 percent

Elevation: 0 to 745 feet (0 to 228 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderate

Flooding: Occasional

Mean annual precipitation: 60 to 75 inches (1,520 to 1,900 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 300 to 330 days

Taxonomic classification: Coarse-loamy, mixed, superactive, nonacid, isomesic Typic Udifluvents

Figure 16.—A profile of a Bigriver soil. These soils form in overbank flood deposits. Texture ranges from loamy sand to very fine sandy loam. Depth is marked in centimeters.

Modal Pedon

Bigriver fine sandy loam, in an area of Bigriver, 2 to 5 percent slopes, on a nearly level slope of 2 percent, under redwood, California laurel, tanoak, red alder, swordfern, and redwood-sorrel, at an elevation of 39 feet (12 meters); in Redwood National Park, Humboldt County, California; USGS Rodger's Peak quadrangle; UTM zone 10, 415267mE, 4562684mN, NAD83.

A—0 to 4 inches (0 to 9 centimeters); black (10YR 2/1) fine sandy loam, gray (10YR 5/1) dry; weak fine granular structure; soft, friable, nonsticky and nonplastic; common very fine and few fine and medium roots; many very fine interstitial and common very fine and few fine tubular pores; moderately acid (pH 6.0); clear wavy boundary.

C—4 to 61 inches (9 to 156 centimeters); stratified very dark gray (10YR 3/1) to very dark grayish brown (10YR 3/2) loamy fine sand to silt loam, gray (10YR 5/1) dry; soft, very friable and friable, nonsticky and slightly sticky and nonplastic; massive; common to many very fine to coarse roots; common very fine and fine tubular pores; moderately acid (pH 6.0).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 5 to 18 percent clay and 0 to 5 percent gravel

Water table: None noted

O horizon (where present)

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 10YR or 2.5Y

Value: 5 or 6 dry, 2 to 4 moist

Chroma: 1 or 2 dry or moist

Texture of the fine-earth fraction: Fine sandy loam or silt loam

Content of clay: 5 to 18 percent

Rock fragments: 0 to 5 percent gravel

Reaction: Slightly acid or moderately acid

C horizon

Hue: 10YR or 2.5Y

Value: 5 or 6 dry, 3 or 4 moist

Chroma: 1 to 3 dry, 1 or 2 moist

Texture of the fine-earth fraction: Stratified loamy sand, loamy fine sand, fine sandy loam, very fine sandy loam, loam, and silt loam

Content of clay: 5 to 18 percent

Rock fragments: 0 to 5 percent gravel

Reaction: Slightly acid or moderately acid

Bigtree Series

Setting

Landscape position: Alluvial fans, fan remnants, and low terraces

Parent material: Alluvium derived from mixed sources

Slope: 2 to 9 percent

Soil Survey of Redwood National and State Parks, California

Elevation: 5 to 670 feet (2 to 205 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderate

Flooding: Rare

Mean annual precipitation: 60 to 75 inches (1,520 to 1,900 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 300 to 320 days

Taxonomic classification: Fine-loamy, isotic, isomesic Andic Dystrudepts

Modal Pedon

Bigtree loam, in an area of Bigtree-Mystery complex, 2 to 9 percent slopes, on a linear, northeast-facing slope of 2 percent, under redwood, hemlock, California huckleberry, Cascade barberry, trillium, and swordfern, at an elevation of 280 feet (85 meters); in Prairie Creek Redwoods State Park, Humboldt County, California; 0.2 kilometer (0.1 mile) east on South Fork trail; USGS Fern Canyon quadrangle; UTM zone 10, 415058mE, 4582332mN, NAD83.

A1—0 to 6 inches (0 to 15 centimeters); very dark brown (10YR 2/2) loam, dark grayish brown (10YR 4/2) dry; moderate very fine and fine granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine and common medium, coarse, and very coarse roots; many very fine and fine interstitial and common fine and medium tubular pores; 3 percent gravel; slightly acid (pH 6.2); abrupt smooth boundary.

A2—6 to 10 inches (15 to 26 centimeters); dark brown (10YR 3/3) loam, brown (10YR 5/3) dry; moderate very fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many medium and coarse and common very fine, fine, and very coarse roots; many very fine and fine interstitial and common fine and medium tubular pores; 3 percent gravel; moderately acid (pH 6.0); abrupt wavy boundary.

Bw1—10 to 22 inches (26 to 56 centimeters); strong brown (7.5YR 4/6) loam, yellowish brown (10YR 5/6) dry; weak very fine and fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many fine and medium and common coarse and very coarse roots; common very fine and fine interstitial and common fine tubular pores; 2 percent gravel; strongly acid (pH 5.4); abrupt smooth boundary.

Bw2—22 to 41 inches (56 to 105 centimeters); dark yellowish brown (10YR 3/4) loam, light yellowish brown (2.5Y 6/4) dry; weak fine subangular blocky structure; moderately hard, firm, slightly sticky and slightly plastic; common fine, medium, and very coarse roots; common very fine and fine interstitial and common fine tubular pores; 1 percent gravel; moderately acid (pH 5.6); abrupt smooth boundary.

Bw3—41 to 47 inches (105 to 120 centimeters); olive brown (2.5Y 4/4) loam, light yellowish brown (2.5Y 6/4) dry; weak fine subangular blocky structure; moderately hard, firm, slightly sticky and slightly plastic; common fine, medium, and coarse roots; common very fine interstitial pores; 1 percent gravel; strongly acid (pH 5.2); abrupt smooth boundary.

2C1—47 to 57 inches (120 to 145 centimeters); olive brown (2.5Y 3/2) sandy loam, grayish brown (2.5Y 5/2) dry; single grain; loose, loose, slightly sticky and slightly plastic; moderately few very fine roots; common very fine interstitial pores; 7 percent gravel; strongly acid (pH 5.2); clear smooth boundary.

2C2—57 to 63 inches (145 to 160 centimeters); olive brown (2.5Y 4/3) silt loam, light yellowish brown (2.5Y 6/3) dry; massive; slightly hard, friable, slightly sticky and

slightly plastic; moderately few very fine roots; common very fine interstitial pores;
1 percent gravel; very strongly acid (pH 5.0).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 18 to 25 percent clay, 0 to 15 percent gravel,
and 0 to 5 percent cobbles

Water table: None noted

O horizon (where present)

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 10YR or 2.5Y

Value: 3 to 5 dry, 2 to 4 moist

Chroma: 2 to 4 dry 2 or 3 moist

Texture of the fine-earth fraction: Loam

Rock fragments: 0 to 10 percent gravel

Content of clay: 15 to 25 percent

Reaction: Moderately acid or strongly acid

Bw horizon

Hue: 7.5YR, 10YR, or 2.5Y

Value: 5 to 7 dry, 3 to 5 moist

Chroma: 2 to 6 dry, 3 to 6 moist

Texture of the fine-earth fraction: Loam or silt loam

Rock fragments: 0 to 15 percent gravel and 0 to 5 percent cobbles

Content of clay: 18 to 25 percent

Reaction: Moderately acid or strongly acid

C horizon

Hue: 10YR or 2.5Y

Value: 5 or 6 dry, 3 or 4 moist

Chroma: 2 to 4 dry or moist

Texture of the fine-earth fraction: Sandy loam or silt loam

Rock fragments: 0 to 35 percent gravel, 0 to 5 percent cobbles, and 0 to 5 percent
paragravel

Content of clay: 5 to 18 percent

Reaction: Strongly acid

Catchings Series

Setting

Landscape position: Uplifted, dissected stream terrace remnants

Parent material: Alluvium derived from mixed sources

Slope: 5 to 30 percent

Elevation: 75 to 845 feet (24 to 258 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderately slow

Soil Survey of Redwood National and State Parks, California

Mean annual precipitation: 75 to 90 inches (1,900 to 2,290 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 240 to 280 days

Taxonomic classification: Loamy-skeletal, mixed, semiactive, isomesic Typic Haplohumults

Modal Pedon

Catchings very gravelly loam, in an area of Battery-Catchings, 5 to 30 percent slopes, on a convex, northwest-facing slope of 20 percent, under redwood, Douglas-fir, western hemlock, tanoak, Pacific rhododendron, California huckleberry, red huckleberry, and salal, at an elevation of 120 feet (37 meters); in Jedediah Smith Redwoods State Park, Del Norte County, California; USGS Hiouchi quadrangle; UTM zone 10, 410475mE, 4626925mN, NAD83.

- A—0 to 10 inches (0 to 25 centimeters); dark brown (10YR 3/3) very gravelly loam, pale brown (10YR 6/3) dry; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine, and medium roots; common very fine and fine tubular and many very fine and fine irregular pores; 35 percent subrounded pebbles and 1 percent subrounded cobbles; strongly acid (pH 5.4); clear wavy boundary.
- BA—10 to 16 inches (25 to 40 centimeters); dark brown (10YR 3/3) very gravelly loam, pale brown (10YR 6/3) dry; moderate very fine and fine subangular blocky structure; slightly hard, friable, moderately sticky and slightly plastic; common very fine, fine, and medium roots; common very fine and fine tubular and irregular pores; 45 percent subrounded pebbles and 1 percent subrounded cobbles; strongly acid (pH 5.3); clear wavy boundary.
- Bt1—16 to 22 inches (40 to 57 centimeters); dark yellowish brown (10YR 4/4) very gravelly clay loam, yellowish brown (10YR 5/4) dry; moderate very fine and weak fine subangular blocky structure; slightly hard, friable, slightly sticky and moderately plastic; common very fine, fine, and medium roots; common very fine and fine tubular pores; few distinct clay films on rock fragments; 45 percent subrounded pebbles; very strongly acid (pH 5.0); clear wavy boundary.
- Bt2—22 to 31 inches (57 to 78 centimeters); dark yellowish brown (10YR 4/6) very gravelly clay loam, brownish yellow (10YR 6/6) dry; weak fine and medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; common very fine, fine, medium, coarse, and very coarse roots; common very fine and fine tubular and irregular pores; few distinct clay films on faces of peds and on rock fragments; 45 percent subrounded pebbles; very strongly acid (pH 5.0); clear smooth boundary.
- Bt3—31 to 39 inches (78 to 100 centimeters); dark yellowish brown (10YR 4/6) very gravelly loam, brownish yellow (10YR 6/6) dry; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine, and medium roots; common very fine and fine tubular and irregular pores; few distinct clay films on rock fragments; 40 percent subrounded pebbles; very strongly acid (pH 4.9); clear smooth boundary.
- Bt4—39 to 52 inches (100 to 132 centimeters); dark yellowish brown (10YR 4/6) gravelly sandy loam, brownish yellow (10YR 6/6) dry; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine, and medium roots; common very fine, fine, and medium tubular and common very fine and fine irregular pores; few distinct clay films on rock fragments; 15 percent subrounded pebbles and 2 percent subrounded cobbles; very strongly acid (pH 4.9); clear smooth boundary.
- Bt5—52 to 63 inches (132 to 160 centimeters); dark yellowish brown (10YR 4/6) extremely gravelly coarse sandy loam, brownish yellow (10YR 6/6) dry; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly

plastic; moderately few very fine roots; common very fine and fine irregular pores; few distinct clay films on rock fragments; 70 percent subrounded pebbles and 3 percent subrounded cobbles; very strongly acid (pH 4.9); clear smooth boundary. Bt6—63 to 69 inches (160 to 175 centimeters); dark yellowish brown (10YR 4/6) silt loam, brownish yellow (10YR 6/6) dry; weak medium and coarse subangular blocky structure; moderately hard, firm, slightly sticky and slightly plastic; common fine and medium roots; common very fine and fine tubular and irregular pores; few distinct clay films on faces of peds; 10 percent subrounded pebbles; very strongly acid (pH 4.5).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 25 to 33 percent clay, 35 to 55 percent gravel, and 0 to 5 percent cobbles

Water table: None noted

Reaction: Strongly acid or very strongly acid

A horizon

Hue: 7.5YR or 10YR

Value: 5 or 6 dry, 3 or 4 moist

Chroma: 3 or 4 dry or moist

Texture of the fine-earth fraction: Loam

Content of clay: 20 to 26 percent

Rock fragments: 35 to 55 percent gravel and 0 to 5 percent cobbles

Upper part of the Bt horizon

Hue: 7.5YR or 10YR

Value: 5 or 6 dry, 4 or 5 moist

Chroma: 4 to 6 dry or moist

Texture of the fine-earth fraction: Loam or clay loam

Content of clay: 23 to 33 percent

Rock fragments: 35 to 55 percent gravel and 0 to 5 percent cobbles

Lower part of the Bt horizon

Hue: 7.5YR or 10YR

Value: 5 or 6 dry, 4 or 5 moist

Chroma: 4 to 6 dry or moist

Texture of the fine-earth fraction: Coarse sandy loam, sandy loam, and silt loam

Content of clay: 5 to 20 percent

Rock fragments: 10 to 85 percent gravel and 0 to 7 percent cobbles

C horizon (where present)

Hue: 7.5YR or 10YR

Value: 6 or 7 dry, 4 to 6 moist

Chroma: 3 to 6 dry, 3 to 5 moist

Texture of the fine-earth fraction: Loamy coarse sand, sandy loam, or loam

Content of clay: 2 to 20 percent

Rock fragments: 40 to 60 percent gravel, 15 to 25 percent cobbles, and 0 to 15 percent stones

Childshill Series

Setting

Landscape position: Moderately broad ridges

Parent material: Colluvium and residuum from weakly consolidated fluvial deposits derived from mixed sources

Slope: 5 to 30 percent

Elevation: 1,785 to 2,350 feet (545 to 717 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderately slow

Mean annual precipitation: 80 to 100 inches (2,030 to 2,550 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 240 to 280 days

Taxonomic classification: Fine-loamy, mixed, semiactive, isomesic Ustic Palehumults

Modal Pedon

Childshill loam, in an area of Childshill, 5 to 30 percent slopes, on a linear northeast-facing slope of 15 percent, under Douglas-fir, tanoak, Pacific rhododendron, salal, brackenfern, and California huckleberry, at an elevation of 643 meters (2,110 feet); in Redwood National and State Parks, Del Norte County, California; USGS Childs Hill quadrangle; UTM zone 10, 415282mE, 4617101mN, NAD83.

A1—0 to 3 inches (0 to 8 centimeters); dark brown (10YR 3/3) loam, yellowish brown (10YR 5/4) dry; weak very fine and fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine, and medium roots; many very fine and fine irregular and common fine tubular pores; 5 percent subrounded pebbles and 1 percent subrounded cobbles; moderately acid (pH 5.8); clear wavy boundary.

A2—3 to 9 inches (8 to 22 centimeters); dark brown (7.5YR 3/3) sandy clay loam, brown (7.5YR 5/4) dry; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine, and medium roots; common very fine and fine irregular and fine tubular pores; 10 percent subrounded pebbles and 1 percent subrounded cobbles; very strongly acid (pH 4.9); abrupt wavy boundary.

Bt1—9 to 22 inches (22 to 55 centimeters); strong brown (7.5YR 4/6) gravelly clay loam, strong brown (7.5YR 5/6) dry; moderate fine and weak medium subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; moderately few very fine and common fine, medium, and coarse roots; common very fine and fine irregular and common medium tubular pores; few distinct clay films on faces of peds and on rock fragments; 15 percent subrounded pebbles and 5 percent subrounded cobbles; very strongly acid (pH 4.8); clear wavy boundary.

Bt2—22 to 35 inches (55 to 90 centimeters); strong brown (7.5YR 4/6) gravelly clay loam, strong brown (7.5YR 5/6) dry; moderate fine and medium and weak coarse subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; common fine, medium, and coarse roots; common very fine and medium tubular pores; few distinct clay films on faces of peds and on rock fragments; 15 percent subrounded pebbles, 3 percent subrounded paragravel, and 5 percent subrounded cobbles; very strongly acid (pH 4.5); clear wavy boundary.

Bt3—35 to 47 inches (90 to 120 centimeters); strong brown (7.5YR 4/6) very cobbly clay loam, strong brown (7.5YR 5/6) dry; moderate fine subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; moderately few fine roots; common very fine irregular and moderately few fine tubular pores; few distinct clay films on faces of peds and on rock fragments; 20 percent subrounded pebbles, 5 percent subrounded paragravel, 15 percent subrounded cobbles, and 5 percent subrounded stones; very strongly acid (pH 4.5); clear wavy boundary.

Bt4—47 to 55 inches (120 to 140 centimeters); strong brown (7.5YR 4/6) very cobbly clay loam, strong brown (7.5YR 5/6) dry; moderate fine subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; moderately few fine roots; common very fine irregular pores; few distinct clay films on faces of peds and on rock fragments; 20 percent subrounded pebbles, 5 percent subrounded paragravel, 15 percent subrounded cobbles, and 5 percent subrounded stones; very strongly acid (pH 4.5); clear wavy boundary.

Bt5—55 to 65 inches (140 to 165 centimeters); strong brown (7.5YR 4/6) very cobbly loam, strong brown (7.5YR 5/6) dry; moderate fine and weak medium subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; common very fine irregular pores; few distinct clay films on faces of peds and on rock fragments; 15 percent subrounded pebbles, 10 percent subrounded paragravel, 20 percent subrounded cobbles, 3 percent subrounded paracobbles, and 5 percent subrounded stones; very strongly acid (pH 4.5).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 27 to 35 percent clay, 0 to 30 percent gravel, 0 to 5 percent paragravel, and 0 to 10 percent cobbles

Water table: None noted

Reaction: Moderately acid to very strongly acid

O horizon (where present)

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 7.5YR or 10YR

Value: 4 to 6 dry, 3 or 4 moist

Chroma: 2 to 4 dry or moist

Texture of the fine-earth fraction: Loam and sandy clay loam

Content of clay: 20 to 27 percent

Rock fragments: 0 to 10 percent gravel and 0 to 5 percent cobbles

Upper part of the Bt horizon

Hue: 7.5YR or 10YR

Value: 4 to 6 dry, 2 to 6 moist

Chroma: 4 to 6 dry, 3 to 7 moist

Texture of the fine-earth fraction: Clay loam

Content of clay: 27 to 35 percent

Rock fragments: 0 to 30 percent gravel, 0 to 5 percent paragravel, and 0 to 10 percent cobbles

Lower part of the Bt horizon

Hue: 7.5YR or 10YR

Value: 4 to 6 dry, 2 to 6 moist

Chroma: 4 to 6 dry, 3 to 7 moist

Texture of the fine-earth fraction: Loam or clay loam

Content of clay: 25 to 35 percent

Rock fragments: 15 to 25 percent gravel, 0 to 10 percent paragravel, 15 to 30 percent cobbles, 0 to 5 percent paracobbles, and 0 to 5 percent stones

Clambeach Series

Setting

Landscape position: Deflation basins and depressions
Parent material: Eolian and marine sand derived from mixed sources
Slope: 0 to 2 percent
Elevation: 0 to 65 feet (0 to 20 meters)
Depth class: Very deep
Drainage class: Very poorly drained
Slowest saturated hydraulic conductivity: Moderate
Slowest permeability: Moderately slow
Mean annual precipitation: 35 to 80 inches (890 to 2,030 millimeters)
Mean annual temperature: 50 to 59 degrees F (10 to 15 degrees C)
Frost-free season: 275 to 330 days
Taxonomic classification: Mixed, isomesic Typic Psammaquents

Modal Pedon

Clambeach sand, in an area of Samoa-Clambeach-Dune land complex, 0 to 50 percent slopes, on a slope of less than 1 percent, under slough sedge, Brewer's rush, Pacific silverweed, and dune willow, at an elevation of 10 feet (3 meters); about 3 miles west of the town of Arcata on the Samoa peninsula, Humboldt County, California; USGS Eureka quadrangle; UTM zone 10, 402054mE, 4524644mN, NAD83.

- A—0 to 9 inches (0 to 22 centimeters); very dark grayish brown (2.5Y 3/2) sand, gray (2.5Y 5/1) dry; weak very fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine and common medium roots; many very fine irregular pores; 10 percent medium prominent dark yellowish brown (10YR 4/6) iron-manganese masses in the matrix; moderately acid (pH 6.0); clear smooth boundary.
- Cg1—9 to 20 inches (22 to 50 centimeters); dark greenish gray (10Y 3/1) sand, greenish gray (10Y 5/1) dry; single grain; loose, loose, nonsticky and nonplastic; many very fine and fine and common medium roots; many very fine and fine interstitial pores; 30 percent coarse prominent olive brown (2.5Y 4/4) iron-manganese masses in the matrix; slightly acid (pH 6.2); clear smooth boundary.
- Cg2—20 to 63 inches (50 to 160 centimeters); dark greenish gray (5GY 3/1) sand, greenish gray (5GY 5/1) dry; single grain; loose, loose, nonsticky and nonplastic; many very fine and fine interstitial pores; 10 percent coarse prominent olive brown (2.5Y 4/3) iron-manganese masses in the matrix; slightly acid (pH 6.4).

Range in Characteristics

Control section (by weighted average): 0 to 1 percent clay and 0 to 30 percent gravel
Water table: At a depth of 6 to 24 inches (15 and 60 centimeters) in December, 0 to 4 inches (0 to 10 centimeters) January through March, 6 to 24 inches (15 and 60 centimeters) in April, 12 to 35 inches (30 and 90 centimeters) May through June, and 35 inches (90 centimeters) to greater than 72 inches (182 centimeters) from June through November
Surface fragments: 0 to 5 percent gravel

A horizon

Hue: 10YR or 2.5Y
Value: 3 to 5 dry, 2 or 3 moist
Chroma: 1 or 2 dry or moist
Content of clay: 0 to 5 percent
Texture of the fine-earth fraction: Sand
Rock fragments: 0 to 5 percent gravel

Reaction: Moderately acid or slightly acid

Redoximorphic features:

Type—fine and medium iron-manganese masses in the matrix

Quantity—few or common

Hue—10YR or 2.5Y

Value—3 to 5

Chroma—3 to 6

Bg horizon (where present)

Hue: 2.5Y or 5Y

Value: 4 or 5 dry, 3 or 4 moist

Chroma: 1 or 2 dry or moist

Content of clay: 0 to 1 percent

Texture of the fine-earth fraction: Sand or fine sand

Reaction: Slightly acid or neutral

Redoximorphic features:

Type—medium or coarse iron-manganese masses in the matrix

Quantity—common or many

Hue—10YR or 2.5Y

Value—3 to 5

Chroma—3 to 6

Cg horizon

Hue: 5Y, 10Y, 5GY, or neutral

Value: 4 to 6 dry, 3 or 4 moist

Chroma: 0 to 2 dry or moist

Content of clay: 0 to 1 percent

Texture of the fine-earth fraction: Sand or fine sand

Reaction: Moderately acid to neutral

Rock fragments: 0 to 30 percent gravel

Redoximorphic features:

Type—medium or coarse iron-manganese masses in the matrix

Quantity—common or many

Hue—7.5YR, 10YR, or 2.5Y

Value—3 to 5

Chroma—3 to 8

Coppercreek Series

Setting

Landscape position: Mountain slopes and broad ridgetops

Parent material: Colluvium and residuum derived from schist, sandstone, and mudstone (fig. 17)

Slope: 9 to 75 percent

Elevation: 50 to 3,040 feet (15 to 926 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderately slow or moderate

Mean annual precipitation: 70 to 100 inches (1,780 to 2,550 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 220 to 300 days

Taxonomic classification: Fine-loamy, mixed, semiactive, isomesic Typic Palehumults

Figure 17.—A profile of a Coppercreek soil. These soils form in colluvium and residuum derived from sandstone, mudstone, or schist. Coppercreek soils are the most abundant soils in the survey area. Depth is marked in centimeters.

Modal Pedon

Coppercreek loam, in an area of Coppercreek-Slidecreek-Tectah complex, 30 to 50 percent slopes, on a uniform, northwest-facing slope of 30 percent, under redwood, Douglas-fir, Pacific rhododendron, California huckleberry, and swordfern, at an elevation of 850 feet (279 meters); in Redwood National and State Parks, Del Norte County, California; USGS Childs Hill quadrangle; UTM zone 10, 412388mE, 4621545mN, NAD83.

- A—0 to 8 inches (0 to 20 centimeters); very dark brown (10YR 2/2) loam, brown (10YR 4/3) dry; weak fine granular and moderate very fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine, fine, medium, and coarse roots; common very fine and fine irregular and common fine and medium tubular pores; 2 percent gravel; very strongly acid (pH 5.0); clear wavy boundary.
- BAt—8 to 15 inches (20 to 38 centimeters); dark yellowish brown (10YR 3/4) clay loam, light yellowish brown (10YR 6/4) dry; moderate very fine and fine subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; common very fine, fine, medium, and very coarse roots; common very fine and fine irregular and common medium and coarse tubular pores; very few distinct clay films on faces of peds and on rock fragments; 2 percent gravel; very strongly acid (pH 4.9); clear wavy boundary.
- Bt1—15 to 20 inches (38 to 52 centimeters); dark yellowish brown (10YR 3/4) clay loam, light yellowish brown (10YR 6/4) dry; moderate fine subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; few very fine, fine, and medium and common very coarse roots; common very fine and fine irregular and common fine, medium, coarse, and very coarse tubular pores; few distinct clay films on faces of peds and on rock fragments; 2 percent gravel; very strongly acid (pH 4.7); clear smooth boundary.
- Bt2—20 to 30 inches (52 to 75 centimeters); dark yellowish brown (10YR 4/4) clay loam, light yellowish brown (10YR 6/4) dry; moderate fine and medium subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; common very fine, fine, medium, coarse, and very coarse roots; common very fine and fine irregular and common fine, coarse, and very coarse tubular pores; few distinct clay films on faces of peds and on rock fragments; 3 percent gravel; very strongly acid (pH 4.6); clear smooth boundary.
- Bt3—30 to 43 inches (75 to 110 centimeters); dark yellowish brown (10YR 4/4) clay loam, light yellowish brown (10YR 6/4) dry; moderate fine and medium subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; common very fine, fine, medium, coarse, and very coarse roots; common very fine and fine irregular and common fine tubular pores; few distinct clay films on faces of peds and on rock fragments; 3 percent gravel; very strongly acid (pH 4.6); clear smooth boundary.
- Bt4—43 to 55 inches (110 to 140 centimeters); strong brown (7.5YR 5/6) clay loam, brownish yellow (10YR 6/6) dry; moderate medium subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; moderately few fine and common medium roots; common very fine and fine irregular and common fine tubular pores; common distinct clay films on faces of peds and on rock fragments; 3 percent gravel; very strongly acid (pH 4.5); clear smooth boundary.
- Bt5—55 to 65 inches (140 to 165 centimeters); strong brown (7.5YR 5/6) paragravelly clay loam, yellow (10YR 7/6) dry; weak medium subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; moderately few fine and common coarse roots; moderately few very fine and fine irregular pores; common distinct clay films on faces of peds and on rock fragments; 5 percent

gravel, 1 percent cobbles, and 10 percent paragravel; very strongly acid (pH 4.5); clear smooth boundary.

B_{Ct}—65 to 79 inches (165 to 200 centimeters); strong brown (7.5YR 5/6) paragravelly clay loam, yellow (10YR 7/6) dry; weak fine subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; moderately few fine and common medium roots; moderately few very fine irregular pores; common faint clay films on faces of peds; 5 percent gravel, 1 percent cobbles, and 12 percent paragravel; very strongly acid (pH 4.5).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 27 to 35 percent clay, 0 to 35 percent gravel, and 0 to 10 percent cobbles

Water table: None noted

Reaction: Strongly acid or very strongly acid

O horizon (where present)

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 7.5YR or 10YR

Value: 4 to 7 dry, 2 to 4 moist

Chroma: 2 to 4 dry or moist

Texture of the fine-earth fraction: Silt loam or loam

Content of clay: 20 to 27 percent

Rock fragments: 0 to 45 percent gravel and 0 to 10 percent cobbles

Bt horizon

Hue: 7.5YR, 10YR, or 2.5Y

Value: 4 to 7 dry, 2 to 6 moist

Chroma: 2 to 6 dry, 3 to 8 moist

Texture of the fine-earth fraction: Loam, silty clay loam, or clay loam

Content of clay: 25 to 35 percent

Rock fragments: 0 to 55 percent gravel, 0 to 30 percent paragravel, and 0 to 10 percent cobbles

C horizon (where present)

Hue: 10YR, 2.5Y, or 5Y

Value: 6 to 8 dry, 4 to 6 moist

Chroma: 2 to 4 dry, 2 to 8 moist

Texture of the fine-earth fraction: Sandy clay loam, loam, or clay loam

Content of clay: 23 to 35 percent

Rock fragments: 15 to 55 percent gravel, 0 to 10 percent cobbles, and 0 to 10 percent stones

Cg horizon below 125 centimeters (where present)

Hue: 5Y, 2.5Y, neutral, 5GY, or 5B

Value: 5 to 7 dry, 2 to 6 moist

Chroma: Neutral to 2 dry, neutral to 2 moist

Texture of the fine-earth fraction: Clay or silty clay

Content of clay: 40 to 50 percent

Rock fragments: 3 to 13 percent

Redoximorphic features:

Type—masses of iron and manganese; iron depletions

Quantity—few or common

Hue—7.5YR or 10YR

Value—6 dry, 5 moist

Chroma—6 dry, 4 to 6 moist

Countshill Series

Setting

Landscape position: Gently convex ridgetops, spur ridges, and mountain slopes

Parent material: Colluvium and residuum derived from siltstone and sandstone

Slope: 9 to 50 percent

Elevation: 500 to 3,385 feet (153 to 1,032 meters)

Depth class: Moderately deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderate

Mean annual precipitation: 85 to 100 inches (2,160 to 2,550 millimeters)

Mean annual temperature: 50 to 59 degrees F (10 to 15 degrees C)

Frost-free season: 200 to 280 days

Taxonomic classification: Fine-loamy, mixed, superactive, mesic Humic Dystrochrepts

Modal Pedon

Countshill loam, in an area of Dolason-Countshill-Airstrip complex, 9 to 30 percent slopes, on a gently convex, southwest-facing slope of 13 percent, under bristly dogstail grass and common sheep sorrel, at an elevation of 2,400 feet (732 meters); in Airstrip Prairie, Redwood National Park, Humboldt County, California; USGS Bald Hills quadrangle; UTM zone 10, 421594mE, 4560248mN, NAD83.

A1—0 to 7 inches (0 to 19 centimeters); dark grayish brown (10YR 4/2) loam, very dark grayish brown (10YR 3/2) moist; weak medium granular and subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine and common medium roots; common very fine irregular and common very fine and fine tubular pores; strongly acid (pH 5.5); 3 percent gravel; gradual wavy boundary.

A2—7 to 20 inches (19 to 51 centimeters); dark grayish brown (10YR 4/2) loam, very dark grayish brown (10YR 3/2) moist; weak coarse subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and fine and few medium roots; common very fine, fine, and medium tubular pores; strongly acid (pH 5.5); 5 percent gravel; abrupt irregular boundary.

AC—20 to 28 inches (51 to 72 centimeters); brown (10YR 5/3) and light olive brown (2.5Y 5/4) variegated very gravelly loam, dark yellowish brown (10YR 3/4) moist; massive; soft, very friable, slightly sticky and slightly plastic; few very fine and fine roots; few very fine and fine tubular pores; strongly acid (pH 5.5); 35 percent gravel and 15 percent cobbles; abrupt wavy boundary.

Cr—28 to 36 inches (72 to 91) centimeters; saprolitic sandy siltstone, easily dug and crushable in one hand; original rock macrostructure still intact throughout; becomes harder at a depth of about 90 centimeters; depth to Cr ranges from 24 to 34 inches (62 to 87 centimeters) across pit face.

Range in Characteristics

Depth to soft bedrock: 20 to 40 inches (50 to 100 centimeters)

Control section (by weighted average): 18 to 30 percent clay, 5 to 35 percent gravel, and 0 to 15 percent cobbles

Water table: None noted

A horizon

Hue: 10YR or 2.5Y

Value: 4 or 5 dry, 2 or 3 moist

Chroma: 1 to 3 dry or moist

Texture of the fine-earth fraction: Loam

Content of clay: 15 to 30 percent

Rock fragments: 0 to 30 percent gravel and 0 to 5 percent cobbles

Reaction: Strongly acid or very strongly acid

Bw horizon (where present)

Hue: 10YR or 2.5Y

Value: 5 to 7 dry, 4 or 5 moist

Chroma: 3 or 4 dry, 2 to 4 moist

Texture of the fine-earth fraction: Sandy loam, loam, or clay loam

Content of clay: 20 to 35 percent

Rock fragments: 35 to 50 percent gravel and 0 to 5 percent cobbles

Reaction: Strongly acid or very strongly acid

C horizon (where present)

Hue: 10YR or 2.5Y

Value: 5 to 7 dry, 4 or 5 moist

Chroma: 3 or 4 dry, 2 to 4 moist

Texture of the fine-earth fraction: Sandy loam, loam, or clay loam

Content of clay: 20 to 35 percent

Rock fragments: 35 to 50 percent gravel and 0 to 55 percent cobbles

Reaction: Strongly acid or very strongly acid

The Countshill soils in map unit 481 are taxadjuncts to the series. These soils have an isomesic soil temperature regime and a udic soil moisture regime. Also, in some pedons they have an Oi horizon. These differences, however, do not affect use and management.

Coyoterock Series

Setting

Landscape position: Poorly incised drainages, hillslope hollows, and lower mountain slopes

Parent material: Colluvium and residuum derived from sandstone, mudstone, and siltstone

Slope: 15 to 50 percent

Elevation: 515 to 3,160 feet (158 to 964 meters)

Depth class: Very deep

Drainage class: Moderately well drained

Slowest saturated hydraulic conductivity: Low

Slowest permeability: Very slow

Mean annual precipitation: 90 to 100 inches (2,290 to 2,550 millimeters)

Mean annual temperature: 50 to 59 degrees F (10 to 15 degrees C)

Frost-free season: 200 to 260 days

Taxonomic classification: Fine, mixed, active, mesic Ultic Haploxeralfs

Modal Pedon

Coyoterock cobbly clay loam, in an area of Pasturerock-Coyoterock-Maneze complex, 30 to 50 percent slopes, on a uniform, west-facing slope of 40 percent, under Oregon white oak, poison oak, snowberry, Sierra gooseberry, annual grasses, perennial grasses, and forbs, at an elevation of 2,450 feet (747 meters); in Redwood

Soil Survey of Redwood National and State Parks, California

National Park, Humboldt County, California; USGS Bald Hills quadrangle; UTM zone 10, 425216mE, 4556279mN, NAD83.

- Oi—0 to 1 inch (0 to 1 centimeter); fresh and slightly decomposed oak leaves, forbs, and grass stems; abrupt wavy boundary.
- A1—1 to 9 inches (1 to 21 centimeters); very dark grayish brown (2.5Y 3/2) cobbly clay loam, grayish brown (2.5Y 5/2) dry; moderate medium and coarse subangular blocky structure; friable, slightly hard, slightly sticky and slightly plastic; many very fine and few fine and medium roots; many very fine and fine irregular pores; 8 percent gravel and 8 percent cobbles; moderately acid (pH 6.0); gradual smooth boundary.
- A2—9 to 16 inches (21 to 41 centimeters); very dark grayish brown (2.5Y 3/2) gravelly clay loam, light brownish gray (2.5Y 6/2) dry; moderate coarse and very coarse subangular blocky structure; friable, slightly hard, slightly sticky and slightly plastic; common very fine and few fine and medium roots; common very fine irregular pores; 15 percent gravel; moderately acid (pH 6.0); abrupt irregular boundary.
- BAt—16 to 29 inches (41 to 73 centimeters); light olive brown (2.5Y 5/4) gravelly clay loam, pale yellow (2.5Y 7/4) dry; moderate coarse and very coarse subangular blocky structure; firm, moderately hard, moderately sticky and moderately plastic; few very fine, fine, and medium roots; few very fine irregular pores; many faint clay films on faces of peds and in pores; 15 percent gravel and 3 percent cobbles; strongly acid (pH 5.5); gradual smooth boundary.
- Bt—29 to 39 inches (73 to 99 centimeters); light olive brown (2.5Y 5/4) gravelly clay, pale yellow (2.5Y 7/4) dry; weak coarse and very coarse subangular blocky structure; firm, moderately hard, very sticky and moderately plastic; common medium and coarse and few very fine and fine roots; few very fine irregular pores; common faint clay films on faces of peds and in pores; common fine prominent yellowish brown (10YR 5/8) masses of iron accumulation, strong brown (7.5YR 5/8) moist; 15 percent gravel; strongly acid (pH 5.5); clear smooth boundary.
- Cg—39 to 60 inches (99 to 152 centimeters); gray (10YR 5/1) gravelly silty clay, light gray (10YR 7/1) dry; massive; very firm, very hard, very sticky and very plastic; few very fine, fine, medium, and coarse roots; few very fine interstitial pores; many fine prominent yellowish brown (10YR 5/6) masses of iron accumulation, strong brown (7.5YR 5/8) moist; 20 percent gravel and 2 percent cobbles, rock content increasing with depth; pH indicator fades.

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 35 to 45 percent clay, 8 to 20 percent gravel, and 0 to 20 percent cobbles

Water table: At a depth of 28 to 40 inches (70 to 102 centimeters)

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Neutral to moderately acid

A horizon

Hue: 10YR or 2.5Y

Value: 4 to 7 dry, 2 to 5 moist

Chroma: 1 to 3 dry, 1 to 4 moist

Texture of the fine-earth fraction: Loam or clay loam

Content of clay: 27 to 30 percent

Rock fragments: 8 to 15 percent gravel and 0 to 15 percent cobbles

Reaction: Moderately acid or strongly acid

Bt horizon

Hue: 10YR or 2.5Y

Value: 5 to 7 dry, 3 to 5 moist

Chroma: 2 to 4 dry or moist

Texture of the fine-earth fraction: Clay loam, silty clay loam, or clay

Content of clay: 35 to 45 percent

Rock fragments: 8 to 20 percent gravel and 0 to 20 percent cobbles

Reaction: Moderately acid or strongly acid

Redoximorphic features:

Type—fine and medium iron-manganese masses in the matrix; iron stains lining root channels and/or pores

Quantity—common or many

Hue—7.5YR, 10YR, or 2.5Y

Value—5 or 6 dry, 4 or 5 moist

Chroma—6 to 8 dry, 4 to 8 moist

Cg horizon

Hue: 10YR, 2.5Y, 5Y, or neutral

Value: 5 to 7 dry, 3 or 5 moist

Chroma: Neutral to 2 dry or moist

Texture of the fine-earth fraction: Clay loam, silty clay loam, silty clay, or clay

Content of clay: 35 to 50 percent

Rock fragments: 5 to 25 percent gravel and 0 to 20 percent cobbles

Reaction: Moderately acid to very strongly acid

Redoximorphic features:

Type—fine and medium iron-manganese masses in the matrix; iron stains lining root channels and/or pores

Quantity—common or many

Hue—7.5YR, 10YR, or 2.5Y

Value—5 or 6 dry, 4 or 5 moist

Chroma—6 to 8 dry, 4 to 8 moist

Darkwoods Series

Setting

Landscape position: Mountain slopes

Parent material: Colluvium and residuum derived from sandstone

Slope: 50 to 75 percent

Elevation: 65 to 4,755 feet (20 to 1,450 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderately slow

Mean annual precipitation: 49 to 80 inches (1,250 to 2,030 millimeters)

Mean annual temperature: 50 to 59 degrees F (10 to 15 degrees C)

Frost-free season: 150 to 250 days

Taxonomic classification: Loamy-skeletal, mixed, active, mesic Typic Haploxerults

Modal Pedon

Darkwoods extremely gravelly loam, in an area of Sidehill-Oakside-Darkwoods complex, 50 to 100 percent slopes, on a convex, northeast-facing slope of 75 percent, under tree cover of tanoak and Douglas-fir with an understory of California

Soil Survey of Redwood National and State Parks, California

huckleberry, salal, and swordfern, at an elevation of 2,650 feet (810 meters); Humboldt County, California; UTM zone 10, 433325mE, 4539140mN, NAD83.

- Oi—0 to 1 inch (0 to 2 centimeters); slightly decomposed plant material; whole leaves that do not break down with rubbing; abrupt smooth boundary.
- A—1 to 7 inches (2 to 19 centimeters); brown (10YR 5/3) extremely gravelly loam, dark brown (10YR 3/3) moist; moderate medium granular and moderate fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine to medium roots; many very fine and fine tubular and common very fine and fine interstitial pores; 60 percent gravel; moderately acid (pH 6.0); clear wavy boundary.
- ABt—7 to 16 inches (19 to 39 centimeters); pale brown (10YR 6/3) very gravelly loam, brown (10YR 4/3) moist; moderate medium and fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine and common medium and coarse roots; common very fine and fine tubular and common very fine interstitial pores; 50 percent gravel; moderately acid (pH 5.8); clear wavy boundary.
- Bt1—16 to 25 inches (39 to 63 centimeters); dark yellowish brown (10YR 4/4) extremely gravelly clay loam, dark yellowish brown (10YR 4/4) moist; moderate fine and very fine subangular blocky and moderate medium granular structure; slightly hard, friable, moderately sticky and moderately plastic; common medium, common fine, common very fine, and common coarse roots; common very fine tubular, common fine tubular, common very fine interstitial, and common fine interstitial pores; few distinct clay films on all faces of peds; 65 percent gravel; moderately acid (pH 5.6); gradual wavy boundary.
- Bt2—25 to 31 inches (63 to 80 centimeters); strong brown (7.5YR 5/6) gravelly clay loam, strong brown (7.5YR 4/6) moist; moderate fine and medium subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; common fine, common medium, and common very fine to coarse roots; common very fine and fine tubular and common very fine and fine interstitial pores; common distinct clay films on all faces of peds; 20 percent gravel; strongly acid (pH 5.4); clear wavy boundary.
- Bt3—31 to 44 inches (80 to 113 centimeters); yellowish brown (10YR 5/4) gravelly loam, strong brown (7.5YR 4/6) moist; moderate fine and medium subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; common very fine, common medium, common fine, and common coarse roots; common very fine and fine tubular and common very fine and fine interstitial pores; common distinct clay films on all faces of peds; 25 percent gravel; strongly acid (pH 5.4); clear wavy boundary.
- BCt—44 to 52 inches (113 to 131 centimeters); light yellowish brown (10YR 6/4) extremely gravelly sandy loam, yellowish brown (10YR 5/4) moist; weak medium and coarse subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine and fine tubular and common very fine and fine interstitial pores; common distinct clay films on all faces of peds and few distinct clay films on surfaces along pores; 60 percent gravel; strongly acid (pH 5.4); clear wavy boundary.
- C—52 to 80 inches (131 to 200 centimeters); pale yellow (2.5Y 7/4) very gravelly loamy sand, light olive brown (2.5Y 5/4) moist; massive; slightly hard, friable, nonsticky and nonplastic; common very fine and fine roots; common very fine and fine tubular and common very fine to medium interstitial pores; 55 percent gravel; strongly acid (pH 5.2).

Range in Characteristics

Depth to fractured bedrock: None observed

Soil Survey of Redwood National and State Parks, California

Control section (by weighted average): 28 to 35 percent clay and 35 to 75 percent gravel

Water table: None noted

Reaction: Moderately acid to very strongly acid

Surface fragments: 10 to 35 percent gravel and 0 to 10 percent cobbles

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Neutral to moderately acid

A horizon

Hue: 7.5YR or 10YR

Value: 4 to 7 dry, 2 to 5 moist

Chroma: 3 to 6 dry, 2 to 6 moist

Texture of the fine-earth fraction: Loam

Content of clay: 15 to 25 percent

Rock fragments: 60 to 85 percent gravel

Upper part of the Bt horizon

Hue: 7.5YR or 10YR

Value: 4 to 7 dry, 4 to 6 moist

Chroma: 4 to 6 dry, 4 to 8 moist

Texture of the fine-earth fraction: Clay loam

Content of clay: 28 to 35 percent

Rock fragments: 35 to 75 percent gravel

Lower part of the Bt horizon

Hue: 7.5YR or 10YR

Value: 4 to 7 dry, 4 to 6 moist

Chroma: 4 to 6 dry, 4 to 8 moist

Texture of the fine-earth fraction: Sandy loam, loam, or clay loam

Content of clay: 15 to 30 percent

Rock fragments: 15 to 55 percent gravel

C horizon (where present)

Hue: 2.5Y, 7.5YR, or 10YR

Value: 4 to 7 dry, 4 to 6 moist

Chroma: 5 or 6 dry, 4 to 8 moist

Texture of the fine-earth fraction: Loamy sand

Content of clay: 5 to 8 percent

Rock fragments: 60 to 75 percent gravel

Devils Creek Series

Setting

Landscape position: Mountain slopes near drainage headwaters

Parent material: Colluvium derived from schist

Slope: 30 to 75 percent

Elevation: 45 to 2,480 feet (15 to 757 meters)

Depth class: Very deep

Drainage class: Moderately well drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderately slow or moderate

Soil Survey of Redwood National and State Parks, California

Mean annual precipitation: 70 to 100 inches (1,780 to 2,550 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 240 to 300 days

Taxonomic classification: Fine-loamy, mixed, semiactive, isomesic Oxyaquic Dystrudepts

Modal Pedon

Devils creek gravelly loam, in an area of Devils creek-Panther creek-Copper creek complex, 30 to 50 percent slopes, on a north-facing uniform slope of 48 percent, under redwood, hemlock, tanoak, dogwood, Pacific rhododendron, salal, swordfern, deer fern, and fivefinger fern, at an elevation of 499 feet (152 meters); in Redwood National Park, Humboldt County, California; USGS Rodger's Peak quadrangle; UTM zone 10, 414152mE, 4560206mN, NAD83.

Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed redwood twigs, leaves, and bark, tanoak leaves, and fern fronds; clear smooth boundary.

A—1 to 6 inches (3 to 15 centimeters); light yellowish brown (10YR 6/4) gravelly loam, dark yellowish brown (10YR 4/6) dry; weak medium granular and subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine roots; common fine irregular and many very fine and fine tubular pores; 33 percent gravel; strongly acid (pH 5.4); gradual wavy boundary.

BA—6 to 14 inches (15 to 35 centimeters); yellowish brown (10YR 5/8) clay loam, light yellowish brown (10YR 6/4) dry; moderate coarse subangular blocky structure; slightly hard, firm, slightly sticky and slightly plastic; common very fine, fine, and medium and few coarse roots; common very fine and fine tubular pores; 6 percent gravel; strongly acid (pH 5.4); gradual wavy boundary.

Bw1—14 to 21 inches (35 to 54 centimeters); strong brown (7.5YR 5/6) clay loam, brownish yellow (10YR 6/6) dry; moderate coarse and very coarse subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine, and medium and few coarse roots; common very fine, fine, and medium tubular pores; 6 percent gravel; strongly acid (pH 5.5); gradual wavy boundary.

Bw2—21 to 30 inches (54 to 75 centimeters); yellowish brown (10YR 5/8) cobbly clay loam, yellowish brown (10YR 5/6) dry; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine, fine, medium, and coarse roots; few very fine and fine tubular pores; 12 percent gravel and 10 percent cobbles; strongly acid (pH 5.2); gradual smooth boundary.

Cg1—30 to 37 inches (75 to 95 centimeters); gray (2.5Y 5/1) very gravelly silt loam, light gray (2.5Y 7/2) dry; massive; slightly hard, friable, slightly sticky and slightly plastic; few very fine and fine roots; few very fine and fine tubular pores; common medium prominent brownish yellow (10YR 6/6) masses of iron accumulation, yellowish brown (10YR 5/8) moist; 40 percent gravel and 10 percent cobbles; strongly acid (pH 5.2); clear wavy boundary.

Cg2—37 to 67 inches (95 to 171 centimeters); variegated olive (5Y 5/3) and gray (5Y 6/1) very gravelly silt loam, light gray (5Y 7/1) dry; massive; slightly hard, friable, slightly sticky and slightly plastic; few very fine, fine, medium, and coarse roots; few very fine tubular pores; common medium prominent strong brown (7.5YR 5/6) masses of iron accumulation, strong brown (7.5YR 5/8) moist; 38 percent gravel and 10 percent cobbles; strongly acid (pH 5.1).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 25 to 35 percent clay, 3 to 25 percent gravel, and 0 to 15 percent cobbles

Water table: At a depth of 24 to 40 inches (60 to 100 centimeters)

Reaction: Moderately acid or strongly acid

O horizon (where present)

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 10YR

Value: 4 to 7 dry, 3 to 6 moist

Chroma: 4 to 6 dry or moist

Texture of the fine-earth fraction: Loam, clay loam, or silty clay loam

Content of clay: 25 to 27 percent

Rock fragments: 15 to 35 percent gravel and 0 to 5 percent cobbles

Bw horizon

Hue: 7.5YR or 10YR

Value: 5 to 8 dry, 4 to 6 moist

Chroma: 4 to 6 dry, 4 to 8 moist

Texture of the fine-earth fraction: Loam or clay loam

Content of clay: 27 to 35 percent

Rock fragments: 3 to 25 percent gravel and 0 to 15 percent cobbles

C or Cg horizon

Hue: 2.5Y, 5Y, or neutral

Value: 4 to 8 dry, 4 to 6 moist

Chroma: Neutral to 3 dry or moist

Texture of the fine-earth fraction: Loam or silt loam

Content of clay: 10 to 25 percent

Rock fragments: 35 to 50 percent gravel and 0 to 10 cobbles

Redoximorphic features:

Type—fine and medium iron-manganese masses in the matrix; iron stains lining root channels and/or pores

Quantity—common or many

Hue—7.5YR or 10YR

Value—5 or 6 moist

Chroma—6 to 8 moist

Dolason Series

Setting

Landscape position: Mountain slopes and ridges

Parent material: Colluvium and residuum derived from siltstone and sandstone (fig. 18)

Slope: 9 to 50 percent

Elevation: 500 to 3,385 feet (153 to 1,032 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderately slow or moderate

Mean annual precipitation: 85 to 100 inches (2,160 to 2,550 millimeters)

Mean annual temperature: 50 to 59 degree F (10 to 15 degrees C)

Frost-free season: 200 to 280 days

Taxonomic classification: Fine-loamy, mixed, superactive, mesic Humic Dystrocherepts

Figure 18.—A profile of a Dolason soil. These soils are in prairies of the Bald Hills area. The thick, dark surface layer is the dominant feature of soils that form under grasses and forbs.

Modal Pedon

Dolason loam, in an area of Dolason-Countshill-Airstrip complex, 9 to 30 percent slopes, on a southwest-facing slope of 15 percent, under western brackenfern and

Soil Survey of Redwood National and State Parks, California

velvetgrass, at an elevation of 3,000 feet (915 meters); on Trail Ridge, Humboldt County, California; USGS Hupa Mountain quadrangle; UTM zone 10, 428525mE, 4551310mN, NAD83.

A1—0 to 6 inches (0 to 16 centimeters); dark grayish brown (10YR 4/2) loam, very dark brown (10YR 2/2) moist; weak medium granular and weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots; common very fine and fine irregular and tubular pores; 5 percent gravel; strongly acid (pH 5.2); gradual wavy boundary.

A2—6 to 17 inches (16 to 44 centimeters); dark grayish brown (10YR 4/2) loam, very dark brown (10YR 2/2) moist; weak fine and medium subangular blocky structure; soft, friable, nonsticky and nonplastic; common very fine and fine roots; common very fine and fine tubular pores; 5 percent gravel; strongly acid (pH 5.4); gradual wavy boundary.

A3—17 to 27 inches (44 to 68 centimeters); grayish brown (10YR 5/2) loam, very dark grayish brown (10YR 3/2) moist; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine and fine tubular pores; 8 percent gravel; strongly acid (pH 5.2); gradual wavy boundary.

A4—27 to 35 inches (68 to 89 centimeters); dark grayish brown (10YR 4/2) loam, very dark brown (10YR 2/2) moist; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine and fine roots; few very fine and fine tubular pores; 10 percent gravel; very strongly acid (pH 5.0); clear wavy boundary.

Bw1—35 to 51 inches (89 to 130 centimeters); yellow (2.5Y 7/6) gravelly loam, yellowish brown (10YR 5/6) moist; moderate medium subangular structure; slightly hard, friable, slightly sticky and moderately plastic; few very fine and fine roots; few very fine, fine, and medium tubular pores; 30 percent gravel and 1 percent cobbles; strongly acid (pH 5.2); gradual wavy boundary.

Bw2—51 to 59 inches (130 to 150 centimeters); yellow (2.5Y 7/6) gravelly loam, yellowish brown (10YR 5/6) moist; weak medium and coarse subangular structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine tubular pores; 30 percent gravel; strongly acid (pH 5.4); gradual wavy boundary.

BC—59 to 65 inches (150 to 165 centimeters); pale yellow (2.5Y 7/4) gravelly loam, olive brown (2.5Y 4/4) moist; massive; slightly hard, friable, slightly sticky and slightly plastic; common very fine interstitial pores; 15 percent gravel; strongly acid (pH 5.4); gradual wavy boundary.

C—65 to 77 inches (165 to 195 centimeters); pale yellow (2.5Y 7/4) very gravelly sandy loam, yellowish brown (10YR 5/6) moist; massive; soft, very friable, slightly sticky and slightly plastic; common very fine interstitial pores; 35 percent gravel; strongly acid (pH 5.4).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 20 to 25 percent clay, 5 to 35 percent gravel, and 0 to 10 percent cobbles

Water table: None noted

Reaction: Strongly acid or very strongly acid

Surface fragments: 0 to 12 percent gravel and 0 to 3 percent cobbles

A horizon

Hue: 10YR or 2.5Y

Value: 4 or 5 dry, 2 or 3 moist

Chroma: 1 to 3 dry or moist

Texture of the fine-earth fraction: Loam

Content of clay: 15 to 27 percent

Rock fragments: 3 to 23 percent gravel and 0 to 10 percent cobbles

Reaction: Strongly acid or very strongly acid

Bw horizon

Hue: 10YR or 2.5Y

Value: 5 to 7 dry, 5 or 6 moist

Chroma: 3 to 6 dry, 4 to 6 moist

Texture of the fine-earth fraction: Loam or clay loam

Content of clay: 20 to 32 percent

Rock fragments: 3 to 50 percent gravel and 0 to 10 percent cobbles

Pararock fragments: 0 to 50 percent paragravel

Reaction: Strongly acid or very strongly acid

C horizon

Hue: 10YR or 2.5Y

Value: 5 to 7 dry, 4 to 6 moist

Chroma: 3 to 6 dry, 4 to 6 moist

Texture of the fine-earth fraction: Sandy loam, loam, or clay loam

Content of clay: 20 to 30 percent

Rock fragments: 35 to 50 percent gravel and 0 to 10 percent cobbles

Reaction: Strongly acid or very strongly acid

The Dolason soils in map unit 481 are taxadjuncts to the series. These soils have an isomesic soil temperature regime and a udic soil moisture regime. Also, in some pedons they have an Oi horizon. These differences, however, do not affect use and management.

Doolyville Series

Setting

Landscape position: Lower mountain slopes or near earthflows

Parent material: Colluvium derived from mudstone and sandstone

Slope: 30 to 50 percent

Elevation: 170 to 2,950 feet (53 to 900 meters)

Depth class: Very deep

Drainage class: Somewhat poorly drained

Slowest saturated hydraulic conductivity: Low

Slowest permeability: Very slow

Mean annual precipitation: 70 to 85 inches (1,780 to 2,160 millimeters)

Mean annual temperature: 50 to 59 degrees F (10 to 15 degrees C)

Frost-free season: 240 to 270 days

Taxonomic classification: Fine-loamy, mixed, superactive, mesic Aquultic Haploxeralfs

Modal Pedon

Doolyville silt loam, in an area of Doolyville-Pasturerock complex, 30 to 50 percent slopes, on a uniform, west-facing slope of 31 percent, under Oregon white oak, poison oak, annual grasses, and perennial grasses, at an elevation of 820 feet (250 meters); in Redwood National Park, Humboldt County, California; USGS Panther Creek quadrangle; UTM zone 10, 422345mE, 4553592mN, NAD83.

Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed oak leaves, grass litter, and moss.

A—1 to 6 inches (3 to 15 centimeters); very dark grayish brown (10YR 3/2) silt loam, grayish brown (10YR 5/2) dry; moderate fine and medium subangular blocky structure; hard, friable, slightly sticky and slightly plastic; many very fine and

Soil Survey of Redwood National and State Parks, California

- common fine roots; common very fine and few fine tubular pores; strongly acid (pH 5.5); 6 percent gravel; gradual wavy boundary.
- ABt—6 to 11 inches (15 to 28 centimeters); dark brown (10YR 3/3) silty clay loam, grayish brown (2.5Y 5/2) dry; weak medium and coarse subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine, common fine, and few medium roots; common very fine and fine tubular pores; few faint clay films on faces of peds; strongly acid (pH 5.5); 5 percent gravel; gradual wavy boundary.
- Bt—11 to 15 inches (28 to 37 centimeters); olive brown (2.5Y 4/3) silty clay loam, light brownish gray (2.5Y 6/2) dry; moderate medium and coarse subangular blocky structure; hard, firm, slightly sticky and slightly plastic; common very fine, fine, and medium roots; common very fine and fine tubular pores; common faint clay films on faces of peds and in pores; strongly acid (pH 5.5); 5 percent gravel; gradual wavy boundary.
- Btg—15 to 18 inches (37 to 46 centimeters); dark gray (5Y 4/1) gravelly silty clay loam, gray (5Y 6/1) dry; weak coarse subangular blocky structure; hard, firm, moderately sticky and slightly plastic; common very fine and fine and few medium roots; common very fine and few fine tubular pores; common distinct clay films on faces of peds and in pores; common medium distinct light yellowish brown (2.5Y 6/4) masses of iron accumulation, light olive brown (2.5Y 5/4) moist; strongly acid (pH 5.5); 25 percent gravel; clear wavy boundary.
- Cg1—18 to 22 inches (46 to 55 centimeters); dark gray (5Y 4/1) gravelly silty clay loam, gray (5Y 5/1) dry; massive; very hard, firm, slightly sticky and slightly plastic; few very fine, fine, and medium roots; common very fine tubular pores; common medium faint light brownish gray (2.5Y 6/2) iron depletions, dark grayish brown (2.5Y 4/2) moist; moderately acid (pH 6.0); 31 percent gravel; clear wavy boundary.
- Cg2—22 to 31 inches (55 to 79 centimeters); dark gray (N 4/0) gravelly silty clay loam, gray (N 5/0) dry; massive; very hard, firm, slightly sticky and slightly plastic; few very fine and fine roots; few very fine tubular pores; neutral (pH 7.0); 24 percent gravel; gradual wavy boundary.
- Cg3—31 to 61 inches (79 to 154 centimeters); dark gray (5Y 4/1) very gravelly loam, gray (N 5/0) dry; massive; hard, firm, slightly sticky and slightly plastic; few very fine and fine roots; few very fine tubular pores; moderately alkaline (pH 8.0); slightly effervescent; 50 percent gravel.

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 27 to 35 percent clay, 10 to 35 percent gravel, and 0 to 15 percent cobbles

Water table: At a depth of 12 to 20 inches (30 to 50 centimeters)

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Neutral to moderately acid

A horizon

Hue: 10YR or 2.5Y

Value: 4 or 5 dry, 2 to 4 moist

Chroma: 1 to 3 dry or moist

Texture of the fine-earth fraction: Silt loam or loam

Content of clay: 20 to 26 percent
Rock fragments: 0 to 13 percent gravel
Reaction: Moderately acid or strongly acid

Bt horizon

Hue: 10YR or 2.5Y
Value: 5 or 6 dry, 4 or 5 moist
Chroma: 2 to 4 dry, 2 or 3 moist
Texture of the fine-earth fraction: Silty clay loam
Content of clay: 30 to 35 percent
Rock fragments: 5 to 35 percent gravel and 0 to 15 percent cobbles
Reaction: Moderately acid or strongly acid

Btg horizon

Hue: 10YR, 2.5Y, or 5Y
Value: 4 to 6 dry, 3 to 5 moist
Chroma: 1 or 2 dry or moist
Texture of the fine-earth fraction: Silty clay loam
Content of clay: 27 to 35 percent
Rock fragments: 15 to 30 percent gravel and 0 to 5 percent cobbles
Reaction: Moderately acid to moderately alkaline
Redoximorphic features:

Type—fine and medium iron-manganese masses in the matrix; iron stains lining root channels and/or pores
Quantity—common or many
Hue—7.5YR, 10YR, or 2.5Y
Value—5 or 6 dry, 4 or 5 moist
Chroma—4 to 6 dry, 4 to 8 moist

Cg horizon

Hue: 10YR, 2.5Y, 5Y, or neutral
Value: 5 or 6 dry, 3 to 5 moist
Chroma: Neutral to 2 dry or moist
Texture of the fine-earth fraction: Loam or silty clay loam
Content of clay: 24 to 40 percent
Rock fragments: 15 to 50 percent gravel and 0 to 10 percent cobbles
Reaction: Moderately acid to moderately alkaline
Redoximorphic features:

Type—fine and medium iron-manganese masses in the matrix; iron stains lining root channels and/or pores
Quantity—common or many
Hue—7.5YR, 10YR, or 2.5Y
Value—5 or 6 dry, 4 or 5 moist
Chroma—2 to 6 dry, 2 to 8 moist

Elkcamp Series

Setting

Landscape position: Irregular mountain slopes
Parent material: Colluvium and residuum derived from siltstone, sandstone, and mudstone
Slope: 15 to 50 percent
Elevation: 610 to 3,230 feet (187 to 985 meters)
Depth class: Very deep
Drainage class: Well drained

Soil Survey of Redwood National and State Parks, California

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderately slow

Mean annual precipitation: 90 to 100 inches (2,290 to 2,550 millimeters)

Mean annual temperature: 50 to 59 degrees F (10 to 15 degrees C)

Frost-free season: 200 to 250 days

Taxonomic classification: Fine-loamy, mixed, superactive, mesic Ultic Palexeralfs

Modal Pedon

Elkcamp loam, in an area of Elkcamp-Dolason-Airstrip complex, 15 to 50 percent slopes, on a convex, southwest-facing slope of 30 percent, under blue wildrye, soft brome, tall oatgrass, and bristly dogstail grass, at an elevation of 2,350 feet (716 meters); in Redwood National Park, Humboldt County, California; USGS Bald Hills quadrangle; UTM zone 10, 421239mE, 4560474mN, NAD83.

A—0 to 8 inches (0 to 20 centimeters); grayish brown (10YR 5/2) loam, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure parting to moderate very fine and fine granular; slightly hard, friable, slightly sticky and slightly plastic; common very fine roots; common very fine and fine irregular and few fine and medium tubular pores; 14 percent gravel; very strongly acid (pH 5.0); gradual smooth boundary.

ABt—8 to 21 inches (20 to 54 centimeters); grayish brown (10YR 5/2) gravelly loam, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure parting to moderate very fine and fine granular; slightly hard, firm, slightly sticky and slightly plastic; common very fine roots; common very fine and fine irregular and few fine and medium tubular pores; 15 percent gravel; few faint clay films in pores; strongly acid (pH 5.2); gradual wavy boundary.

Bt1—21 to 37 inches (54 to 95 centimeters); light gray (10YR 7/2) gravelly clay loam, yellowish brown (10YR 5/4) moist; moderate medium subangular blocky structure; slightly hard and hard, firm, moderately sticky and moderately plastic; common very fine roots; few very fine irregular and fine and medium tubular pores; many distinct clay films on faces of peds and in pores; 16 percent gravel; strongly acid (pH 5.3); gradual wavy boundary.

Bt2—37 to 49 inches (95 to 125 centimeters); light gray (10YR 7/1) gravelly clay loam, light olive brown (2.5Y 5/4) moist; moderate medium subangular blocky structure; slightly hard and hard, firm, moderately sticky and moderately plastic; few very fine roots; few very fine irregular and tubular and medium tubular pores; common faint and few distinct clay films on faces of peds and many distinct clay films in pores; 25 percent gravel; strongly acid (pH 5.3); gradual wavy boundary.

Bt3—49 to 65 inches (125 to 166 centimeters); light gray (10YR 7/1) very gravelly clay loam, yellowish brown (10YR 5/4) moist; moderate medium subangular blocky structure; hard, firm, moderately sticky and moderately plastic; few very fine interstitial and tubular pores; common faint and few distinct clay films on faces of peds and many distinct clay films in pores; many medium distinct yellow (10YR 7/8) masses of iron accumulation, yellowish brown (10YR 5/6) moist, and few fine prominent reddish yellow (7.5YR 6/8) masses of iron accumulation, yellowish brown (10YR 5/8) moist; 39 percent gravel; manganese coatings on gravel surfaces; strongly acid (pH 5.4).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 23 to 35 percent clay, 10 to 25 percent gravel, and 0 to 10 percent cobbles

Water table: At a depth of 40 to 60 inches (100 to 152 centimeters)

Reaction: Moderately acid to very strongly acid

Surface fragments: 0 to 15 percent gravel

A horizon

Hue: 10YR or 2.5Y

Value: 4 or 5 dry, 2 or 3 moist

Chroma: 1 to 3 dry, 1 or 2 moist

Texture of the fine-earth fraction: Loam

Content of clay: 20 to 26 percent

Rock fragments: 0 to 15 percent gravel

Bt horizon

Hue: 10YR or 2.5Y

Value: 5 to 7 dry, 3 to 5 moist

Chroma: 1 to 4 dry, 2 to 4 moist

Texture of the fine-earth fraction: Clay loam or silty clay loam

Content of clay: 27 to 35 percent

Rock fragments: 15 to 50 percent gravel and 0 to 10 percent cobbles

Redoximorphic features:

Type—fine and medium iron-manganese masses in the matrix; iron stains lining root channels and/or pores

Value—5 to 7 dry or moist

Chroma—6 to 8 dry, 4 to 8 moist

Cg horizon (where present)

Hue: 2.5Y or 5Y

Value: 5 to 8 dry, 4 to 6 moist

Chroma: 1 to 4 dry, neutral to 4 moist

Texture of the fine-earth fraction: Clay loam or silty clay

Rock fragments: 10 to 40 percent gravel

Content of clay: 35 to 45 percent

Redoximorphic features:

Type—fine and medium iron-manganese masses in the matrix; iron stains lining root channels and/or pores

Quantity—common or many

Hue—5YR, 7.5YR, or 10YR

Value—5 to 7 dry or moist

Chroma—6 to 8 dry or moist

Espa Series

Setting

Landscape position: Uplifted, dissected marine terrace remnants

Parent material: Colluvium and residuum from weakly consolidated beach and dune deposits

Slope: 2 to 9 percent

Elevation: 160 to 740 feet (49 to 227 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderate

Mean annual precipitation: 60 to 75 inches (1,520 to 1,900 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 280 to 325 days

Taxonomic classification: Fine-loamy, mixed, superactive, isomesic Typic Haplohumults

Modal Pedon

Espe loam, in an area of Espe, 2 to 9 percent slopes, on a slightly convex, northeast-facing slope of 9 percent, under redwood, Sitka spruce, red alder, cascara, Douglas-fir, western thimbleberry, salmonberry, salal, and swordfern, at an elevation of 580 feet (176 meters); in Redwood National Park, Humboldt County, California; USGS Orick quadrangle; UTM zone 10, 411041mE, 4575503mN, NAD83.

- Oi—0 to 3 inches (0 to 7 centimeters); fresh and slightly decomposed conifer needles, alder leaves, alder twigs, mosses, and fungus; clear smooth boundary.
- A—3 to 8 inches (7 to 20 centimeters); very dark grayish brown (10YR 3/2) loam, brown (10YR 5/3) dry; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and fine and few medium roots; common very fine and fine tubular and interstitial pores; moderately acid (pH 6.0); clear wavy boundary.
- ABt—8 to 16 inches (20 to 41 centimeters); very dark grayish brown (10YR 3/2) loam, brown (10YR 5/3) dry; moderate very fine and fine subangular blocky structure; slightly hard, friable, sticky and moderately plastic; common very fine and fine and few medium and coarse roots; common very fine and fine and few medium and coarse tubular pores; few faint clay films on surfaces along root channels and on faces of peds; moderately acid (pH 6.0); clear smooth boundary.
- Bt1—16 to 25 inches (41 to 63 centimeters); light yellowish brown (10YR 6/4) loam, brownish yellow (10YR 6/6) dry; moderate fine and medium subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; common very fine and fine and few medium and coarse roots; common very fine and fine and few medium tubular pores; common distinct clay films on surfaces along root channels and common distinct clay films on faces of peds; strongly acid (pH 5.2); clear wavy boundary.
- Bt2—25 to 35 inches (63 to 89 centimeters); strong brown (7.5YR 5/8) loam, reddish yellow (7.5YR 6/8) dry; moderate medium subangular blocky structure; moderately hard, firm, slightly sticky and slightly plastic; common very fine and fine and few medium and coarse roots; common very fine and fine tubular and interstitial pores; common distinct clay films on surfaces along root channels, few distinct clay films on faces of peds, and few distinct clay films between sand grains; very strongly acid (pH 5.0); clear wavy boundary.
- Bt3—35 to 47 inches (89 to 120 centimeters); strong brown (7.5YR 5/8) loam, brownish yellow (10YR 6/8) dry; moderate medium and coarse subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine and few coarse and very coarse roots; common very fine and fine tubular and interstitial pores; common distinct clay films on surfaces along root channels, many distinct clay films between sand grains, and few faint clay films on faces of peds; very strongly acid (pH 5.0); clear smooth boundary.
- BCt—47 to 61 inches (120 to 156 centimeters); strong brown (7.5YR 5/8) sandy loam, reddish yellow (7.5YR 6/8) dry; weak coarse and very coarse subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few fine, medium, and coarse roots; common very fine and fine interstitial and few very fine and fine tubular pores; common distinct clay films lining surfaces along root channels and common clay films between sand grains; very strongly acid (pH 5.0); clear wavy boundary.
- C—61 to 79 inches (156 to 200 centimeters); yellowish brown (10YR 5/8) sandy loam, brownish yellow (10YR 6/8) dry; massive; slightly hard, friable, slightly sticky and slightly plastic; few fine, coarse, and very coarse roots; common very fine and fine interstitial and few very fine tubular pores; very strongly acid (pH 5.0).

Content of clay: 18 to 25 percent

Bt horizon

Hue: 7.5YR, 10YR, or 2.5Y

Value: 4 to 7 dry, 3 to 6 moist

Chroma: 4 to 8 dry or moist

Texture of the fine-earth fraction: Loam or clay loam

Content of clay: 18 to 35 percent

C horizon

Hue: 7.5YR, 10YR, or 2.5Y

Value: 5 to 7 dry, 4 to 6 moist

Chroma: 2 to 8 dry or moist

Texture of the fine-earth fraction: Sandy loam or fine sandy loam

Content of clay: 5 to 18 percent

Ferndale Series

Setting

Landscape position: High flood-plain steps

Parent material: Alluvium derived from mixed sources

Slope: 0 to 5 percent

Elevation: 5 to 160 feet (3 to 50 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderately slow

Flooding: Rare

Mean annual precipitation: 35 to 80 inches (890 to 2,030 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 275 to 330 days

Taxonomic classification: Fine-silty, mixed, superactive, nonacid, mesic Typic Udifluvents

Modal Pedon

Ferndale silt loam, in an area of Ferndale, 0 to 2 percent slopes, on a slope of 1 percent, under pasture grasses, buttercup, and clover, at an elevation of 33 feet (10

meters); Humboldt County, California; USGS Fortuna quadrangle; UTM zone 10, 397578mE, 4493778mN, NAD83.

- Ap—0 to 11 inches (0 to 28 centimeters); very dark grayish brown (2.5Y 3/2) silt loam, light brownish gray (2.5Y 6/2) dry; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine to medium roots; many very fine and fine tubular pores; few fine distinct dark yellowish brown (10YR 4/6) iron-manganese masses; slightly acid (pH 6.5); gradual wavy boundary.
- C1—11 to 16 inches (28 to 41 centimeters); dark grayish brown (2.5Y 4/2) silt loam, light brownish gray (2.5Y 6/2) dry; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine roots; common very fine tubular pores; neutral (pH 7.0); gradual wavy boundary.
- C2—16 to 21 inches (41 to 53 centimeters); dark grayish brown (2.5Y 4/2) silt loam, light brownish gray (2.5Y 6/2) dry; massive; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine tubular pores; neutral (pH 7.0); gradual wavy boundary.
- C3—21 to 50 inches (53 to 127 centimeters); dark grayish brown (2.5Y 4/2) silt loam, light brownish gray (2.5Y 6/2) dry; massive; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine tubular pores; neutral (pH 7.0); clear wavy boundary.
- C4—50 to 60 inches (127 to 152 centimeters); dark grayish brown (2.5Y 4/2) fine sandy loam, light brownish gray (2.5Y 6/2) dry; massive; soft, very friable, nonsticky and nonplastic; common very fine and fine roots; common very fine tubular pores; slightly alkaline (pH 7.5).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 18 to 30 percent clay

Water table: None noted within a depth of 40 inches (102 centimeters)

Reaction: Slightly acid to slightly alkaline

A or Ap horizon

Hue: 10YR or 2.5Y

Value: 6 dry, 2 to 4 moist

Chroma: 1 to 3 dry, 1 or 2 moist

Texture of the fine-earth fraction: Silt loam

Content of clay: 18 to 27 percent

Redoximorphic features:

Type—fine and medium iron-manganese masses in the matrix; iron stains lining root channels and/or pores

Quantity—few or common

Hue—10YR or 2.5Y

Value—5 to 7 dry, 3 or 4 moist

Chroma—4 to 6 moist

Upper part of the C horizon

Hue: 10YR or 2.5Y

Value: 5 to 7 dry, 3 or 4 moist

Chroma: 1 to 3 dry, 1 or 2 moist

Texture of the fine-earth fraction: Silt loam or silty clay loam

Content of clay: 18 to 30 percent

Lower part of the C horizon

Hue: 10YR or 2.5Y

Value: 5 to 7 dry, 3 or 4 moist

Chroma: 1 to 3 dry, 1 or 2 moist

Texture of the fine-earth fraction: Silt loam, silty clay loam, or fine sandy loam

Content of clay: 10 to 30 percent

Redoximorphic features (where present):

Type—fine and medium iron-manganese masses in the matrix; iron stains lining root channels and/or pores

Quantity—few or common

Hue—10YR or 2.5Y

Value—4 or 5 dry or moist

Chroma—4 to 6 dry or moist

The Ferndale soils in map units 173 and 222 are taxadjuncts to the series. These soils are moderately well drained. This difference, however, does not affect use and management.

Flintrock Series

Setting

Landscape position: Unstable lower hillslopes

Parent material: Debris-flow colluvium derived from sandstone and mudstone (fig. 19)

Slope: 15 to 75 percent

Elevation: 0 to 695 feet (0 to 213 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderate

Slowest permeability: Slow

Mean annual precipitation: 60 to 80 inches (1,520 to 2,030 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 300 to 365 days

Taxonomic classification: Loamy-skeletal, mixed, superactive, isomesic Typic Hapludolls

Modal Pedon

Flintrock very gravelly clay loam, in an area of Flintrock-Highprairie complex, 15 to 75 percent slopes, on a linear, west-facing slope of 65 percent, under prostrate Sitka spruce, cowparsnip, brackenfern, wild cucumber, fireweed, foxglove, and riggut brome, at an elevation of 120 feet (37 meters); in Redwood National Park, Del Norte County, California; USGS Requa quadrangle; UTM zone 10, 409841mE, 4596236mN, NAD83.

A—0 to 10 inches (0 to 25 centimeters); very dark grayish brown (10YR 3/2) very gravelly clay loam, brown (10YR 4/3) dry; moderate very fine and fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine, and medium and few coarse roots; common very fine and fine tubular and common very fine, fine, and medium irregular tubular pores; 35 percent gravel; slightly acid (pH 6.2); clear wavy boundary.

Bw1—10 to 18 inches (25 to 47 centimeters); very dark grayish brown (2.5Y 3/2) very gravelly clay loam, light olive brown (2.5Y 5/3) dry; moderate very fine and fine subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; common very fine, fine, and medium roots; common very fine and fine tubular and common very fine, fine, and medium irregular pores; 55 percent gravel, 2 percent cobbles, and 10 percent stones; slightly acid (pH 6.2); clear wavy boundary.

Bw2—18 to 31 inches (47 to 78 centimeters); dark olive gray (5Y 3/2) extremely

Figure 19.—A profile of a Flintrock soil. These soils are in coastal prairies and scrub communities on hillslopes adjacent to the ocean. These soils form in stabilized debris slides under grasses and forbs. Depth is marked in centimeters.

gravelly clay loam, olive gray (5Y 5/2) dry; weak fine and medium subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; common very fine, fine, medium, coarse, and very coarse roots; common very fine and fine tubular and common very fine, fine, and medium irregular pores; 60 percent gravel and 1 percent cobbles; moderately acid (pH 6.0); clear wavy boundary.

BC—31 to 38 inches (78 to 97 centimeters); very dark gray (5Y 3/1) very gravelly clay loam, gray (5Y 5/1) dry; weak medium subangular structure; moderately hard, firm, moderately sticky and moderately plastic; very few very fine, moderately few fine, and common very coarse roots; common very fine and fine tubular and very fine and fine irregular pores; 55 percent gravel; moderately acid (pH 6.0); clear wavy boundary.

C1—38 to 46 inches (97 to 118 centimeters); very dark gray (5Y 3/1) extremely gravelly clay loam, dark gray (5Y 5/1) dry; massive; moderately hard, firm, moderately sticky and moderately plastic; very few very fine and common very coarse roots; common very fine and fine irregular pores; 65 percent gravel; slightly acid (pH 6.5); clear wavy boundary.

C2—46 to 63 inches (118 to 160 centimeters); black (5Y 2.5/1) extremely gravelly clay loam, dark gray (5Y 4/1) dry; massive; moderately hard, firm, moderately sticky and moderately plastic; very few very fine roots; common very fine and fine irregular pores; 70 percent gravel and 2 percent cobbles; slightly acid (pH 6.5).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 27 to 35 percent clay, 35 to 60 percent gravel, 0 to 10 percent cobbles, and 0 to 10 percent stones

Water table: None noted

Reaction: Moderately acid or slightly acid

Surface fragments: 0 to 30 percent gravel and 0 to 10 percent cobbles

A horizon

Hue: 10YR, 2.5Y, or 5Y

Value: 3 to 5 dry, 2.5 or 3 moist

Chroma: 1 to 3 dry or moist

Texture of the fine-earth fraction: Clay loam

Content of clay: 27 to 32 percent

Rock fragments: 35 to 50 percent gravel and 0 to 7 percent cobbles

Bw horizon

Hue: 10YR, 2.5Y, 5Y, or neutral

Value: 4 to 6 dry, 3 to 6 moist

Chroma: Neutral to 3 dry, neutral to 2 moist

Texture of the fine-earth fraction: Clay loam

Content of clay: 27 to 35 percent

Rock fragments: 35 to 60 percent gravel, 0 to 10 percent cobbles, and 0 to 10 percent stones

C horizon

Hue: 5Y or neutral

Value: 4 to 6 dry, 2.5 to 4 moist

Chroma: Neutral or 1 dry or moist

Texture of the fine-earth fraction: Clay loam

Content of clay: 27 to 40 percent

Rock fragments: 20 to 70 percent gravel and 0 to 50 percent cobbles

Fluents

Setting

Landscape position: Terraces and flood plains

Parent material: Overbank alluvium derived from mixed sources

Slope: 2 to 5 percent

Elevation: 0 to 570 feet (0 to 175 meters)

Depth class: Very deep

Drainage class: Somewhat excessively drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderately rapid

Flooding: Frequent

Mean annual precipitation: 60 to 75 inches (1,520 to 1,900 millimeters)

Mean annual temperature: 50 to 59 degrees F (10 to 15 degrees C)

Frost-free season: 300 to 330 days

Taxonomic classification: Fluents

Modal Pedon

Fluents, in an area of Fluents, 2 to 5 percent slopes, on a level, gently undulating surface, under perennial grasses and forbs with scattered willows, coyotebrush, and red alder, at an elevation of 29 feet (9 meters); in Redwood National Park, Humboldt County, California; USGS Orick quadrangle; UTM zone 10, 413179mE, 4572408mN, NAD83.

A—0 to 2 inches (0 to 5 centimeters); gray (10YR 5/1) fine sandy loam, very dark gray (10YR 3/1) moist; gradual smooth boundary.

C1—2 to 9 inches (5 to 24 centimeters); gray (10YR 5/1) loam, very dark gray (10YR 3/1) moist; gradual smooth boundary.

2C2—9 to 37 inches (24 to 94 centimeters); gray (N 5/0) loamy sand, very dark gray (N 3/0) moist; gradual smooth boundary.

2C3—37 to 40 inches (94 to 102 centimeters); gray (N 5/0) very gravelly loamy coarse sand, very dark gray (N 3/0) moist; 40 percent gravel; gradual smooth boundary.

3C4—40 to 60 inches (102 to 152 centimeters); rounded pebbles and cobbles with coarse sand in interstices; impenetrable by a soil auger.

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 0 to 5 percent clay, 0 to 55 percent gravel, 0 to 10 percent cobbles, and 0 to 5 percent stones

Water table: At a depth of 0 to 10 centimeters (0 to 4 inches) November through April

Reaction: Moderately acid or slightly acid

Surface fragments: 0 to 10 percent gravel

A horizon

Hue: 10YR or 2.5Y

Value: 5 or 6 dry, 3 or 4 moist

Chroma: 1 or 2 dry or moist

Texture of the fine-earth fraction: Fine sandy loam

Content of clay: 0 to 15 percent

Rock fragments: 0 to 5 percent gravel

C horizon

Hue: 10YR or 2.5Y

Value: 5 or 6 dry, 3 or 4 moist

Chroma: 1 or 2 dry or moist

Texture of the fine-earth fraction: Fine sandy loam, very fine sandy loam, or loam

Content of clay: 0 to 15 percent

Rock fragments: 0 to 5 percent gravel

2C horizon

Hue: 10YR, 2.5Y, or neutral

Value: 5 or 6 dry, 3 or 4 moist

Chroma: Neutral or 1 dry, neutral or 1 moist

Texture of the fine-earth fraction: Loamy coarse sand, coarse sand, sand, or loamy sand

Content of clay: 0 to 5 percent

Rock fragments: 0 to 55 percent gravel, 0 to 10 percent cobbles, and 0 to 5 percent stones

3C horizon (where present)

Texture of the fine-earth fraction: Rounded river pebbles and cobbles packed with coarse loamy sand to a depth of many meters

Footstep Series

Setting

Landscape position: Narrow ridges and convex to uniform upper mountain slopes

Parent material: Colluvium and residuum derived from sandstone and mudstone

Slope: 5 to 75 percent

Elevation: 15 to 1,695 feet (5 to 518 meters)

Depth class: Moderately deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderately slow

Mean annual precipitation: 65 to 90 inches (1,650 to 2,290 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 250 to 300 days

Taxonomic classification: Loamy-skeletal, mixed, superactive, isomesic Typic Haplohumults

Modal Pedon

Footstep gravelly loam, in an area of Sisterrocks-Ladybird-Footstep complex, 50 to 75 percent slopes, on a convex, northwest-facing slope of 55 percent, under redwood, Douglas-fir, tanoak, California huckleberry, salal, and swordfern, at an elevation of 640 feet (195 meters); in Del Norte Redwoods State Park, Del Norte County, California; USGS Sister Rocks quadrangle; UTM zone 10, 405516mE, 4616844mN, NAD83.

A1—0 to 3 inches (0 to 7 centimeters); black (10YR 2/1) gravelly loam, dark grayish brown (10YR 4/2) dry; moderate very fine and fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine and common medium roots; many very fine and fine interstitial and tubular pores; 25 percent gravel; very strongly acid (pH 5.0); clear smooth boundary.

A2—3 to 7 inches (7 to 18 centimeters); very dark brown (10YR 2/2) gravelly loam, dark grayish brown (10YR 4/2) dry; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine and common medium and coarse roots; many very fine and fine interstitial and tubular pores; 30 percent gravel; very strongly acid (pH 4.9); clear smooth boundary.

Bt1—7 to 14 inches (18 to 35 centimeters); very dark grayish brown (10YR 3/2) very

gravelly loam, brown (10YR 5/3) dry; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; many fine and medium tubular and common very fine and fine interstitial pores; 40 percent gravel and 5 percent cobbles; very strongly acid (pH 4.7); clear wavy boundary.

Bt2—14 to 28 inches (35 to 70 centimeters); dark yellowish brown (10YR 4/4) extremely gravelly clay loam, light yellowish brown (10YR 6/4) dry; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and moderately plastic; few distinct clay films on rock fragments; common very fine and fine roots; many fine and medium tubular and common very fine and fine interstitial pores; 55 percent gravel and 10 percent cobbles; very strongly acid (pH 4.7); abrupt wavy boundary.

R—28 to 79 inches (70 to 200 centimeters); fractured hard sandstone, lithic material with cracks greater than 10 centimeters apart; approximately 1 percent soil material in fractures and pockets.

Range in Characteristics

Depth to hard bedrock: 20 to 40 inches (50 to 100 centimeters)

Control section (by weighted average): 26 to 35 percent clay, 35 to 65 percent gravel, and 0 to 15 percent cobbles

Water table: None noted

Reaction: Strongly acid or very strongly acid

Surface fragments: 0 to 25 percent gravel and 0 to 5 percent cobbles

Oi horizon (where present)

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 10YR

Value: 4 or 5 dry, 2 or 3 moist

Chroma: 2 to 4 dry, 1 to 3 moist

Texture of the fine-earth fraction: Loam

Content of clay: 18 to 27 percent

Rock fragments: 15 to 30 percent gravel and 0 to 5 percent cobbles

Bt horizon

Hue: 10YR

Value: 5 or 6 dry, 3 or 4 moist

Chroma: 3 or 4 dry, 2 to 4 moist

Texture of the fine-earth fraction: Loam or clay loam

Content of clay: 23 to 35 percent

Rock fragments: 35 to 65 percent gravel and 0 to 15 percent cobbles

C horizon (where present)

Hue: 7.5YR, 10YR, or 2.5Y

Value: 5 to 7 dry, 3 to 5 moist

Chroma: 3 to 6 dry, 2 to 6 moist

Texture of the fine-earth fraction: Loam or clay loam

Content of clay: 23 to 35 percent

Rock fragments: 35 to 85 percent gravel and 0 to 35 percent cobbles

Fortyfour Series

Setting

Landscape position: Spur ridges and convex upper mountain slopes

Parent material: Colluvium and residuum derived from schist

Slope: 30 to 50 percent

Elevation: 295 to 2,555 feet (90 to 780 meters)

Depth class: Moderately deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately low

Slowest permeability: Slow

Mean annual precipitation: 70 to 100 inches (1,780 to 2,550 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 240 to 280 days

Taxonomic classification: Fine, parasquic, isomesic Typic Hapludults

Modal Pedon

Fortyfour silty clay loam, in an area of Trailhead-Fortyfour complex, 30 to 50 percent slopes, on a convex, southeast-facing slope of 30 percent, under Douglas-fir, hemlock, redwood, tanoak, red alder, Pacific rhododendron, California huckleberry, and salal, at an elevation of 1,230 feet (375 meters); in Redwood National Park, Humboldt County, California; USGS Rodger's Peak quadrangle; UTM zone 10, 412313mE, 4565346mN, NAD83.

Oi—0 to 1 inch (0 to 1 centimeter); slightly decomposed Douglas-fir needles and twigs.

A—1 to 12 inches (1 to 31 centimeters); yellowish red (5YR 4/6) silty clay loam, strong brown (7.5YR 5/6) dry; moderate medium subangular blocky structure parting to moderate fine subangular blocky; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine and common medium roots; many very fine and fine irregular and common fine and medium tubular pores; 13 percent gravel; very strongly acid (pH 5.0); gradual wavy boundary.

BAt—12 to 18 inches (31 to 46 centimeters); yellowish red (5YR 4/6) silty clay, yellowish red (5YR 5/8) dry; moderate coarse subangular blocky structure parting to moderate medium subangular blocky; hard, friable, slightly sticky and slightly plastic; common fine and medium and few coarse roots; few very fine and fine irregular and common fine and medium tubular pores; 14 percent gravel; very strongly acid (pH 5.0); gradual wavy boundary.

Bt1—18 to 30 inches (46 to 77 centimeters); yellowish red (5YR 4/6) gravelly clay, yellowish red (5YR 5/8) dry; moderate coarse subangular blocky structure; hard, firm, moderately sticky and slightly plastic; common fine and medium and few coarse roots; common fine, medium, and coarse tubular pores; common distinct clay films on faces of peds, red (2.5YR 4/6) moist; 20 percent gravel; strongly acid (pH 5.2); gradual wavy boundary.

Bt2—30 to 39 inches (77 to 99 centimeters); yellowish red (5YR 5/8) clay, variegated reddish yellow (5YR 6/6) and yellow (10YR 7/8) dry; moderate medium subangular blocky structure parting to moderate fine subangular blocky; hard, firm, moderately sticky and slightly plastic; few fine, medium, and coarse roots; few fine, medium, and coarse tubular pores; few distinct clay films on faces of peds; 10 percent gravel; very strongly acid (pH 4.9); abrupt wavy boundary.

Cr—39 inches (99 centimeters); strongly reddened, fractured, weathered quartz-mica schist with a few narrow seams of red clay.

Range in Characteristics

Depth to soft bedrock: 20 to 40 inches (50 to 100 centimeters)

Control section (by weighted average): 40 to 45 percent clay and 3 to 20 percent gravel

Water table: None noted

Reaction: Strongly acid or very strongly acid

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 5YR or 7.5YR

Value: 5 dry, 3 or 4 moist

Chroma: 4 to 6 dry or moist

Texture of the fine-earth fraction: Silty clay loam

Content of clay: 27 to 35 percent

Rock fragments: 3 to 13 percent gravel

Bt horizon

Hue: 2.5YR, 5YR, or 7.5YR

Value: 5 to 7 dry, 4 or 5 moist

Chroma: 6 to 8 dry or moist

Texture of the fine-earth fraction: Silty clay or clay

Content of clay: 40 to 50 percent

Rock fragments: 3 to 20 percent gravel

The Fortyfour soils in map unit 563 are taxadjuncts to the series. These soils have an ustic soil moisture regime. This difference, however, does not affect use and management.

Gasquet Series

Setting

Landscape position: Mountain slopes

Parent material: Residuum and colluvium derived from serpentinized peridotite

Slope: 9 to 50 percent

Elevation: 510 to 2,515 feet (156 to 768 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately low or low

Slowest permeability: Slow or very slow

Mean annual precipitation: 90 to 120 inches (2,290 to 3,050 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 140 to 180 days

Taxonomic classification: Fine, parasesquic, mesic Typic Haploxerults

Modal Pedon

Gasquet stony loam, in an area of Gasquet-Walnett-Jayel complex, 9 to 50 percent slopes, on a southwest-facing slope of 25 percent, under Douglas-fir, sugar pine, and shrubs, at an elevation of 560 feet (171 meters); in Six Rivers National Forest, Del Norte County, California; USGS Gasquet, California, quadrangle; NE¹/₄SW¹/₄ sec. 21, T. 17 N., R. 2 E., Humboldt Base Meridian.

Oi—0 to 1 inch (0 to 2 centimeters); fresh and decomposing leaf and needle litter; strongly acid (pH 5.3).

- A—1 to 10 inches (2 to 25 centimeters); reddish yellow (5YR 6/6) stony loam, reddish brown (5YR 4/3) moist; moderate very fine granular structure; soft, friable, slightly sticky and slightly plastic; common very fine and fine, many medium, and common coarse roots; many very fine interstitial and tubular pores; 15 percent stones; moderately acid (pH 6.0); clear smooth boundary.
- Bt1—10 to 22 inches (25 to 56 centimeters); red (2.5YR 4/6) stony clay loam, yellowish red (5YR 4/6) moist; weak very fine subangular blocky structure parting to strong very fine granular; slightly hard, firm, sticky and plastic; few very fine, fine, medium, and coarse roots; many very fine interstitial and tubular pores; common moderately thick clay films on peds and in pores; 15 percent stones; slightly acid (pH 6.2); gradual smooth boundary.
- Bt2—22 to 43 inches (56 to 109 centimeters); dark red (2.5YR 3/6) stony clay loam, yellowish red (5YR 4/6) moist; moderate very fine subangular blocky structure parting to moderate fine granular; slightly hard, firm, slightly sticky and slightly plastic; few very fine and fine roots; many very fine interstitial and tubular pores; common moderately thick clay films on peds and in pores; 15 percent stones; slightly acid (pH 6.4); gradual smooth boundary.
- Bt3—43 to 54 inches (109 to 137 centimeters); yellowish red (5YR 4/6) stony silty clay loam, reddish brown (5YR 4/4) moist; moderate very fine subangular blocky structure parting to moderate fine granular; hard, firm, sticky and plastic; few fine roots; many very fine interstitial pores; few moderately thick clay films on peds and in pores; 15 percent stones; slightly acid (pH 6.5); clear smooth boundary.
- Bt4—54 to 61 inches (137 to 155 centimeters); strong brown (7.5YR 5/6) stony silty clay loam, strong brown (7.5YR 4/6) moist; weak very fine subangular blocky structure; slightly hard, firm, sticky and plastic; few medium roots; common very fine interstitial pores; few moderately thick clay films on peds and in pores; 15 percent stones; slightly acid (pH 6.4).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 35 to 45 percent clay and 10 to 35 percent rock fragments

Water table: None noted

Surface fragments: 3 to 15 percent stones

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 5YR or 7.5YR

Value: 3 to 6 dry, 3 or 4 moist

Chroma: 4 to 6 dry, 3 or 4 moist

Texture of the fine-earth fraction: Loam

Content of clay: 23 to 27 percent

Rock fragments: 0 to 20 percent cobbles and 10 to 20 percent stones

Reaction: Slightly acid or moderately acid

Bt horizon

Hue: 2.5YR, 5YR, or 7.5YR

Value: 3 to 5 dry, 4 moist

Chroma: 4 to 6 dry or moist

Texture of the fine-earth fraction: Clay loam, silty clay loam, or clay
Content of clay: 35 to 45 percent
Rock fragments: 0 to 15 percent cobbles and 5 to 15 percent stones
Reaction: Neutral to moderately acid

Goldbluffs Series

Setting

Landscape position: Narrow ridges on hillslopes
Parent material: Colluvium and residuum from weakly consolidated fluvial and beach deposits derived from mixed sources
Slope: 9 to 50 percent
Elevation: 15 to 1,010 feet (6 to 309 meters)
Depth class: Very deep
Drainage class: Well drained
Slowest saturated hydraulic conductivity: Moderately high
Slowest permeability: Moderate
Mean annual precipitation: 60 to 80 inches (1,520 to 2,030 millimeters)
Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)
Frost-free season: 260 to 325 days
Taxonomic classification: Loamy-skeletal, isotic, isomesic Typic Dystrudepts

Modal Pedon

Goldbluffs gravelly loam, in an area of Ossagon-Goldbluffs-Squashan complex, 30 to 50 percent slopes, on a convex, southeast-facing slope of 45 percent, at an elevation of 197 feet (60 meters), under redwood, Douglas-fir, western hemlock, tanoak, California huckleberry, salmonberry, salal, swordfern, false lily of the valley, insideout flower, and Cascade barberry; in Prairie Creek Redwoods State Park, Humboldt County, California; on Miner's Ridge; 0.64 kilometers (0.25 miles) west on Miner's Ridge Trail from junction with James Irvine Trail in Prairie Creek Redwoods State Park; USGS Orick quadrangle; UTM zone 10, 414186mE, 4580155mN, NAD83.

- Oi—0 to 1 inch (0 to 3 centimeters); very dark brown (10YR 2/2) fresh and slightly decomposed conifer needles, tanoak leaves, and twigs, brown (10YR 5/3) dry; common very fine roots; many very fine and fine interstitial pores; 2 percent well rounded pebbles and 1 percent well rounded cobbles; very strongly acid (pH 4.8); abrupt smooth boundary.
- A—1 to 10 inches (3 to 25 centimeters); very dark brown (10YR 2/2) gravelly loam, brown (10YR 4/3) dry; moderate fine subangular blocky and strong medium granular structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine, medium, and coarse roots; common very fine and fine interstitial and common very fine, fine, medium, and coarse tubular pores; 30 percent well rounded pebbles; very strongly acid (pH 4.7); abrupt smooth boundary.
- Bt1—10 to 17 inches (25 to 42 centimeters); brown (7.5YR 4/4) very gravelly sandy loam, reddish yellow (7.5YR 6/6) dry; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common medium, coarse, and very coarse roots; common very fine and fine interstitial and common very fine and medium tubular pores; few distinct clay films on rock fragments; 45 percent well rounded pebbles; very strongly acid (pH 4.8); clear smooth boundary.
- Bt2—17 to 23 inches (42 to 59 centimeters); strong brown (7.5YR 4/6) very gravelly sandy loam, reddish yellow (7.5YR 6/6) dry; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common fine, medium, and coarse roots; common very fine and fine interstitial and common very fine, fine, and medium tubular pores; few distinct clay films on rock fragments;

- 50 percent well rounded pebbles; very strongly acid (pH 4.5); clear smooth boundary.
- Bt3—23 to 37 inches (59 to 95 centimeters); strong brown (7.5YR 5/6) very gravelly sandy loam, reddish yellow (7.5YR 6/6) dry; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common fine, medium, coarse, and very coarse roots; common very fine and fine interstitial and tubular pores; few distinct clay films on rock fragments; 52 percent well rounded pebbles and 5 percent paragravel; extremely acid (pH 4.4); clear smooth boundary.
- BC—37 to 47 inches (95 to 119 centimeters); yellowish brown (10YR 5/6) very gravelly coarse sandy loam, yellow (10YR 6/6) dry; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common medium and coarse roots; common very fine interstitial and common very fine and fine tubular pores; 60 percent well rounded pebbles and 15 percent paragravel; extremely acid (pH 4.3); clear wavy boundary.
- C1—47 to 56 inches (119 to 142 centimeters); yellowish brown (10YR 5/6) extremely gravelly coarse sandy loam, brownish yellow (10YR 6/6) dry; massive; moderately hard, firm, slightly sticky and nonplastic; common medium roots; common very fine interstitial and common fine tubular pores; 5 percent prominent manganese coats on rock fragments; 60 percent well rounded pebbles and 20 percent paragravel; extremely acid (pH 4.4); clear wavy boundary.
- C2—56 to 69 inches (142 to 175 centimeters); yellowish brown (10YR 5/6) extremely gravelly sandy loam, brownish yellow (10YR 6/6) dry; massive; moderately hard, firm, slightly sticky and nonplastic; moderately few very fine interstitial pores; 10 percent prominent manganese coats on rock fragments; 70 percent well rounded pebbles, 20 percent paragravel, and 3 percent well rounded cobbles; extremely acid (pH 4.4).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 5 to 17 percent clay, 35 to 60 percent gravel, and 0 to 3 percent cobbles

Water table: None noted

Reaction: Moderately acid to very strongly acid

Surface fragments: 0 to 20 percent gravel and 0 to 5 percent cobbles

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 10YR

Value: 4 or 5 dry, 2 or 3 moist

Chroma: 3 dry, 2 or 3 moist

Texture of the fine-earth fraction: Loam

Content of clay: 15 to 25 percent

Rock fragments: 30 to 45 percent gravel and 0 to 3 percent cobbles

Bt horizon

Hue: 7.5YR or 10YR

Value: 5 or 6 dry, 4 or 5 moist

Chroma: 4 to 6 dry, 4 to 8 moist

Texture of the fine-earth fraction: Loamy sand, coarse sandy loam, sandy loam, or loam

Content of clay: 2 to 17 percent

Rock fragments: 35 to 60 percent gravel and 0 to 3 percent cobbles

Pararock fragments: 0 to 7 percent

C horizon

Hue: 10YR

Value: 6 or 7 dry, 4 or 5 moist

Chroma: 4 to 6 dry or moist

Texture of the fine-earth fraction: Loamy sand, coarse sandy loam, or sandy loam

Content of clay: 2 to 10 percent

Rock fragments: 35 to 75 percent gravel and 3 to 7 percent cobbles

Pararock fragments: 10 to 20 percent paragravel

Higoaks Series

Setting

Landscape position: Mountain slopes

Parent material: Colluvium and residuum derived from mudstone and sandstone

Slope: 30 to 50 percent

Elevation: 110 to 3,900 feet (35 to 1,190 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderately slow

Mean annual precipitation: 49 to 80 inches (1,250 to 2,030 millimeters)

Mean annual temperature: 50 to 59 degrees F (10 to 15 degrees C)

Frost-free season: 150 to 250 days

Taxonomic classification: Fine-loamy, mixed, superactive, mesic Xeric Palehumults

Modal Pedon

Higoaks gravelly loam, in an area of Higoaks-Noisy-Mudhorse complex, 9 to 50 percent slopes, on a strongly convex, west-facing slope of 50 percent, under a stand of Oregon white oak, California black oak, annual grasses, and perennial grasses, at an elevation of 3,700 feet (1,100 meters); Humboldt County, California; USGS Board Camp Mountain quadrangle; UTM zone 10, 440988mE, 4509801mN, NAD83.

Oi—0 to 1 inch (0 to 2 centimeters); very dark gray (10YR 3/1) slightly decomposed plant material consisting of needles and leaves of Oregon white oak, black (10YR 2/1) moist; about 100 percent fiber unrubbed, 80 percent rubbed; few very fine roots; many fine irregular pores; slightly acid (pH 6.4); abrupt smooth boundary.

A—1 to 9 inches (2 to 22 centimeters); very dark grayish brown (10YR 3/2) gravelly loam, black (10YR 2/1) moist; moderate fine subangular blocky structure parting to strong very fine granular; soft, very friable, nonsticky and nonplastic; many very fine to medium roots; common very fine and fine tubular pores; 30 percent gravel; slightly acid (pH 6.4); clear smooth boundary.

Bt1—9 to 20 inches (22 to 51 centimeters); yellowish brown (10YR 5/4) silty clay loam, dark yellowish brown (10YR 4/4) moist; strong fine and medium subangular blocky structure; slightly hard, friable, very sticky and very plastic; many very fine and fine and common medium roots; many very fine and common medium tubular pores; few faint clay films on all faces of peds; 10 percent gravel; very strongly acid (pH 4.8); clear smooth boundary.

Bt2—20 to 31 inches (51 to 80 centimeters); dark yellowish brown (10YR 4/4) gravelly silty clay loam, brown (10YR 4/3) moist; strong fine and medium subangular blocky

structure; slightly hard, friable, very sticky and very plastic; many very fine and fine and common medium roots; many very fine and common fine tubular pores; common distinct clay films on all faces of peds; 30 percent gravel; very strongly acid (pH 4.8); clear smooth boundary.

Bt3—31 to 42 inches (80 to 107 centimeters); light olive brown (2.5Y 5/4) gravelly silty clay, olive brown (2.5Y 4/3) moist; strong fine subangular blocky structure; slightly hard, friable, very sticky and very plastic; many fine and medium roots; many medium and coarse tubular pores; common distinct clay films on all faces of peds; 20 percent gravel; very strongly acid (pH 4.8); clear smooth boundary.

Bt4—42 to 50 inches (107 to 127 centimeters); olive brown (2.5Y 4/4) very paragravelly silty clay loam, dark olive brown (2.5Y 3/3) moist; strong fine subangular blocky structure; slightly hard, friable, very sticky and very plastic; many fine and common medium roots; many fine and medium tubular pores; common distinct clay films on all faces of peds; 50 percent paragravel; very strongly acid (pH 4.8); clear smooth boundary.

BCt—50 to 63 inches (127 to 160 centimeters); olive brown (2.5Y 4/4) extremely paragravelly silty clay loam, dark olive brown (2.5Y 3/3) moist; weak fine subangular blocky structure; slightly hard, friable, very sticky and very plastic; common fine and common medium roots; common coarse tubular pores; few faint clay films on all faces of peds; 90 percent paragravel; very strongly acid (pH 4.8).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 28 to 35 percent clay and 5 to 35 percent gravel

Water table: None noted

Surface fragments: 0 to 5 percent gravel

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 10YR or 2.5Y

Value: 3 to 5 dry, 2 to 4 moist

Chroma: 2 to 4 dry, 1 to 3 moist

Texture of the fine-earth fraction: Loam

Content of clay: 12 to 25 percent

Rock fragments: 20 to 35 percent gravel

Reaction: Neutral to very strongly acid

Upper part of the Bt horizon

Hue: 10YR or 2.5Y

Value: 3 to 5 dry or moist

Chroma: 2 to 4 dry or moist

Texture of the fine-earth fraction: Silty clay loam

Content of clay: 30 to 35 percent

Rock fragments: 0 to 35 percent gravel

Reaction: Moderately acid to very strongly acid

Lower part of the Bt horizon

Hue: 10YR or 2.5Y

Value: 3 to 5 dry or moist
Chroma: 2 to 4 dry or moist
Texture of the fine-earth fraction: Silty clay loam or silty clay
Content of clay: 30 to 40 percent
Rock fragments: 5 to 55 percent gravel
Reaction: Moderately acid to very strongly acid

C horizon (where present)

Hue: 10YR or 2.5Y
Value: 3 to 5 dry or moist
Chroma: 2 to 4 dry or moist
Texture of the fine-earth fraction: Sandy clay loam or sandy clay
Content of clay: 30 to 38 percent
Pararock fragments: 55 to 95 percent paragravel
Reaction: Moderately acid to very strongly acid

Highprairie Series

Setting

Landscape position: Upper hillslopes
Parent material: Colluvium and residuum derived from sandstone and mudstone
Slope: 15 to 75 percent
Elevation: 0 to 695 feet (0 to 213 meters)
Depth class: Very deep
Drainage class: Well drained
Slowest saturated hydraulic conductivity: Moderately high
Slowest permeability: Slow
Mean annual precipitation: 60 to 80 inches (1,520 to 2,030 millimeters)
Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)
Frost-free season: 300 to 365 days
Taxonomic classification: Fine-loamy, mixed, superactive, isomesic Pachic
Hapludolls

Modal Pedon

Highprairie clay loam, in an area of Flintrock-Highprairie complex, 15 to 75 percent slopes, on a linear, west-facing slope of 45 percent, under coyotebrush, brackenfern, wild cucumber, wild oats, orchardgrass, and velvetgrass, at an elevation of 560 feet (171 meters); in Redwood National Park, Del Norte County, California; USGS Requa quadrangle; UTM zone 10, 409339mE, 4600892mN, NAD83.

- A1—0 to 8 inches (0 to 20 centimeters); very dark grayish brown (2.5Y 3/2) clay loam, light olive brown (2.5Y 5/3) dry; moderate fine and weak very fine subangular blocky structure; slightly hard, friable, slightly sticky and moderately plastic; many very fine and common fine roots; many very fine tubular and common very fine and fine interstitial and tubular pores; 10 percent gravel; moderately acid (pH 5.8); clear smooth boundary.
- A2—8 to 15 inches (20 to 39 centimeters); very dark grayish brown (2.5Y 3/2) clay loam, light olive brown (2.5Y 5/3) dry; moderate fine subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; common very fine roots; common very fine tubular and common very fine and fine interstitial and tubular pores; 10 percent gravel; moderately acid (pH 6.0); clear smooth boundary.
- Bw1—15 to 26 inches (39 to 65 centimeters); very dark grayish brown (2.5Y 3/2) clay loam, light olive brown (2.5Y 5/3) dry; weak fine and medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; common

Soil Survey of Redwood National and State Parks, California

very fine and fine roots; common very fine tubular and common very fine and fine interstitial and tubular pores; 8 percent gravel; moderately acid (pH 5.6); gradual smooth boundary.

Bw2—26 to 37 inches (65 to 93 centimeters); very dark grayish brown (2.5Y 3/2) gravelly clay loam, light yellowish brown (2.5Y 6/3) dry; weak fine and medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; common very fine roots; common very fine tubular and common very fine and fine interstitial pores; 15 percent gravel; moderately acid (pH 5.6); gradual smooth boundary.

Bw3—37 to 47 inches (93 to 120 centimeters); very dark grayish brown (2.5Y 3/2) clay loam, light brownish gray (2.5Y 6/2) dry; weak fine and medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; moderately few very fine roots; common very fine and fine interstitial and tubular pores; 10 percent gravel; strongly acid (pH 5.6); clear smooth boundary.

Bw4—47 to 55 inches (120 to 140 centimeters); very dark grayish brown (2.5Y 3/2) gravelly clay loam, light brownish gray (2.5Y 6/2) dry; weak fine subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; moderately few very fine roots; 15 percent gravel; moderately acid (pH 5.6); clear smooth boundary.

BC—55 to 67 inches (140 to 170 centimeters); dark gray (5Y 4/1) gravelly clay loam, gray (5Y 6/1) dry; weak fine subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; moderately few very fine roots; 20 percent gravel; moderately acid (pH 5.6).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 27 to 35 percent clay and 0 to 35 percent rock fragments

Water table: None noted

Reaction: Moderately acid to slightly acid

A horizon

Hue: 10YR or 2.5Y

Value: 3 to 5 dry, 2 or 3 moist

Chroma: 1 to 3 dry or moist

Texture of the fine-earth fraction: Clay loam

Content of clay: 27 to 32 percent

Rock fragments: 0 to 15 percent gravel

Bw horizon

Hue: 10YR, 2.5Y, or 5Y

Value: 4 to 6 dry, 3 to 5 moist

Chroma: 2 to 4 dry, 1 to 3 moist

Texture of the fine-earth fraction: Clay loam

Content of clay: 27 to 35 percent

Rock fragments: 0 to 35 percent gravel

C horizon (where present)

Hue: 2.5Y or 5Y

Value: 4 to 6 dry, 2 to 4 moist

Chroma: 1 or 2 dry or moist

Texture of the fine-earth fraction: Clay loam

Content of clay: 27 to 40 percent

Rock fragments: 15 to 35 percent gravel

Houda Series

Setting

Landscape position: Stabilized debris slides on hillslopes

Parent material: Debris slide deposits derived from mudstone and sandstone

Slope: 30 to 75 percent

Elevation: 5 to 960 feet (2 to 294 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderately slow

Mean annual precipitation: 70 to 80 inches (1,780 to 2,030 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 275 to 325 days

Taxonomic classification: Loamy-skeletal, mixed, superactive, isomesic Oxyaquic
Eutrudepts

Modal Pedon

Houda gravelly loam, in an area of Sisterrocks-Sasquatch-Houda complex, 30 to 75 percent slopes, on a linear, northwest-facing slope of 40 percent, under Sitka spruce and red alder, at an elevation of 320 feet (97 meters); in Redwood National Park, Del Norte County, California; USGS Requa quadrangle; UTM zone 10, 408425mE, 4603157mN, NAD83.

Oi—0 to 1 inch (0 to 3 centimeters); fresh and decomposing conifer needles and twigs; 2 percent gravel; common very fine and fine roots; very strongly acid (pH 5.0); abrupt smooth boundary.

A—1 to 8 inches (3 to 21 centimeters); black (10YR 2/1) gravelly loam, very dark grayish brown (10YR 3/2) dry; weak fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine, fine, and medium roots; many very fine and fine and common medium tubular and many very fine and fine and common coarse irregular pores; 15 percent gravel and 1 percent cobbles; moderately acid (pH 5.8); clear smooth boundary.

BA—8 to 15 inches (21 to 38 centimeters); very dark grayish brown (2.5Y 3/2) gravelly clay loam, grayish brown (2.5Y 5/2) dry; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and moderately plastic; common very fine, fine, medium, and coarse roots; common very fine, fine, and medium tubular and many very fine and fine and common medium irregular pores; 25 percent gravel and 2 percent cobbles; moderately acid (pH 6.0); clear wavy boundary.

Bw1—15 to 22 inches (38 to 55 centimeters); very dark grayish brown (2.5Y 3/2) very gravelly clay loam, light olive brown (2.5Y 5/3) dry; weak fine and medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; moderately few very fine and fine and common very coarse roots; common fine and medium tubular and common very fine and fine irregular pores; 45 percent gravel and 2 percent cobbles; very moderately acid (pH 5.8); clear wavy boundary.

Bw2—22 to 33 inches (55 to 85 centimeters); very dark gray (2.5Y 3/1) very gravelly clay loam, gray (2.5Y 5/1) dry; weak fine angular blocky and medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; moderately few very fine and fine and common medium and coarse roots; common very fine and fine tubular and irregular pores; 45 percent gravel and 3 percent cobbles; moderately acid (pH 6.0); clear wavy boundary.

C1—33 to 43 inches (85 to 110 centimeters); very dark gray (5Y 3/1) very gravelly

clay loam, gray (5Y 5/1) dry; massive; slightly hard, friable, moderately sticky and moderately plastic; moderately few very fine, fine, and medium and common coarse roots; common very fine and fine tubular and irregular pores; 45 percent gravel and 2 percent cobbles; slightly acid (pH 6.5); clear smooth boundary.

C2—43 to 53 inches (110 to 135 centimeters); very dark gray (5Y 3/1) very gravelly clay loam, gray (5Y 5/1) dry; massive; slightly hard, friable, moderately sticky and moderately plastic; very few very fine and fine roots; common very fine and fine tubular and irregular pores; 50 percent gravel and 2 percent cobbles; slightly acid (pH 6.5); clear wavy boundary.

C3—53 to 60 inches (135 to 152 centimeters); very dark gray (5Y 3/1) extremely gravelly clay loam, gray (5Y 5/1) dry; massive; slightly hard, friable, moderately sticky and moderately plastic; common very fine and fine irregular pores; 65 percent gravel and 7 percent cobbles; neutral (pH 7.0).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 28 to 35 percent clay, 35 to 55 percent gravel, and 0 to 7 percent cobbles

Water table: At a depth of 24 to 40 inches (60 to 100 centimeters)

O horizon (where present)

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 10YR or 2.5Y

Value: 3 to 5 dry, 2 or 3 moist

Chroma: 2 to 4 dry, 1 to 3 moist

Texture of the fine-earth fraction: Loam

Content of clay: 20 to 27 percent

Rock fragments: 15 to 30 percent gravel and 0 to 7 percent cobbles

Reaction: Slightly acid or moderately acid

Bw horizon

Hue: 10YR, 2.5Y, or 5Y

Value: 5 to 7 dry, 3 to 5 moist

Chroma: 1 to 4 dry or moist

Texture of the fine-earth fraction: Clay loam

Content of clay: 28 to 35 percent

Rock fragments: 35 to 55 percent gravel and 0 to 7 percent cobbles

Reaction: Slightly acid or moderately acid

C horizon

Hue: 10YR, 2.5Y, or 5Y

Value: 4 to 6 dry, 2 to 4 moist

Chroma: 1 to 3 dry or moist

Texture of the fine-earth fraction: Clay loam

Content of clay: 28 to 35 percent

Rock fragments: 35 to 85 percent gravel and 0 to 7 percent cobbles

Reaction: Moderately acid to neutral

Jayel Series

Setting

Landscape position: Mountain slopes

Parent material: Residuum and colluvium derived from serpentinized peridotite

Slope: 9 to 75 percent

Elevation: 180 to 3,010 feet (55 to 918 meters)

Depth class: Moderately deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately low or low

Slowest permeability: Slow or very slow

Mean annual precipitation: 90 to 120 inches (2,290 to 3,050 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 140 to 180 days

Taxonomic classification: Fine, parasesquic, mesic Typic Dystrochrepts

Modal Pedon

Jayel stony clay loam, in an area of Jayel-Walnett-Oragan complex, 9 to 30 percent slopes, extremely stony, on a southeast-facing slope of 10 percent, under Jeffrey pine, knobcone pine, Douglas-fir, pinemat manzanita, Idaho fescue, and California fescue with 10 percent stones on the surface, at an elevation of 2,400 feet (732 meters); in Six Rivers National Forest, Del Norte County, California; USGS High Divide, California, quadrangle; NE¹/₄NE¹/₄ sec. 34, T. 18 N., R. 1 E., Humboldt Base Meridian.

Oi—0 to 1 inch (0 to 2 centimeters); fresh and decomposing leaf and needle litter; strongly acid (pH 5.3).

A—1 to 11 inches (2 to 28 centimeters); reddish brown (2.5YR 4/4) stony clay loam, dark brown (7.5YR 4/4) moist; moderate very fine granular structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine, common fine and medium, and few coarse roots; many very fine interstitial pores; 15 percent shot-sized nodules (1 to 2 millimeters) and 15 percent stones; neutral (pH 6.6); clear smooth boundary.

BA—11 to 19 inches (28 to 48 centimeters); yellowish red (5YR 4/6) stony clay, strong brown (7.5YR 5/6) moist; weak very fine subangular blocky structure; soft, very friable, slightly sticky and plastic; few very fine, common fine, and few medium and coarse roots; many very fine interstitial pores; 10 percent gravel, 5 percent cobbles, and 10 percent stones; neutral (pH 6.8); gradual smooth boundary.

Bw—19 to 32 inches (48 to 81 centimeters); yellowish red (5YR 4/6) stony clay, strong brown (7.5YR 5/6) moist; weak very fine subangular blocky structure; soft, very friable, slightly sticky and plastic; few very fine, common fine, and few medium and coarse roots; many very fine interstitial pores; 5 percent gravel and 10 percent stones; neutral (pH 6.6); clear smooth boundary.

R—32 inches (81 centimeters); fractured peridotite; fractures are 25 to 50 centimeters apart.

Range in Characteristics

Depth to hard bedrock: 20 to 40 inches (50 to 100 centimeters)

Control section (by weighted average): 35 to 45 percent clay and 10 to 30 percent rock fragments

Water table: None noted

Surface fragments: 3 to 15 percent stones

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist
Kind of organic material: Slightly decomposed
Content of clay: 0 to 5 percent
Wood fragments: 0 to 35 percent
Reaction: Moderately acid to very strongly acid

A horizon

Hue: 2.5YR, 5YR, or 7.5YR
Value: 4 or 5 dry, 3 or 4 moist
Chroma: 4 to 6 dry or moist
Texture of the fine-earth fraction: Clay loam
Content of clay: 27 to 40 percent
Rock fragments: 0 to 15 percent gravel and 15 to 20 percent stones
Reaction: Neutral to moderately acid

Bw horizon

Hue: 5YR, 7.5YR, or 10YR
Value: 4 or 5 dry or moist
Chroma: 6 to 8 dry, 4 to 6 moist
Texture of the fine-earth fraction: Clay loam, clay, or silty clay
Content of clay: 35 to 45 percent
Rock fragments: 0 to 20 percent gravel, 0 to 10 percent cobbles, and 0 to 15 percent stones
Reaction: Neutral to moderately acid

C horizon (where present)

Hue: 5YR, 7.5YR, or 10YR
Value: 4 or 5 dry or moist
Chroma: 6 to 8 dry, 4 to 6 moist
Texture of the fine-earth fraction: Clay loam or clay
Content of clay: 35 to 45 percent
Rock fragments: 0 to 15 percent gravel and 0 to 20 percent cobbles and stones
Reaction: Neutral to moderately acid

Lackscreek Series

Setting

Landscape position: Strongly convex mountain slopes and narrow ridges
Parent material: Colluvium and residuum derived from sandstone, mudstone, and schist
Slope: 15 to 75 percent
Elevation: 60 to 3,040 feet (19 to 926 meters)
Depth class: Moderately deep
Drainage class: Well drained
Slowest saturated hydraulic conductivity: Moderately high
Slowest permeability: Moderately slow
Mean annual precipitation: 70 to 100 inches (1,780 to 2,550 millimeters)
Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)
Frost-free season: 220 to 300 days
Taxonomic classification: Loamy-skeletal, mixed, active, isomesic Typic Haplohumults

Modal Pedon

Lackscreek very gravelly loam, in an area of Slidecreek-Lackscreek-Coppercreek complex, 50 to 75 percent slopes, on a convex, south-facing slope of 65 percent, under tanoak, Douglas-fir, redwood, red alder, coyotebrush, pampas grass, and yarrow, at an elevation of 850 feet (279 meters); in Redwood National and State Parks,

Soil Survey of Redwood National and State Parks, California

Del Norte County, California; USGS Childs Hill quadrangle; UTM zone 10, 408144mE, 4618515mN, NAD83.

A—0 to 5 inches (0 to 13 centimeters); brown (10YR 4/3) very gravelly loam, pale brown (10YR 6/3) dry; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine, medium, and very coarse roots; many very fine and fine irregular and many very fine and fine and common medium tubular pores; 40 percent gravel and 1 percent cobbles; very strongly acid (pH 4.6); clear wavy boundary.

BAt—5 to 17 inches (13 to 42 centimeters); dark yellowish brown (10YR 4/4) very gravelly loam, light yellowish brown (10YR 6/4) dry; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; moderately few very fine and common fine and medium roots; many very fine and fine irregular and common very fine, fine, medium, and very coarse tubular pores; very few faint clay films on faces of peds; 50 percent gravel and 2 percent cobbles; very strongly acid (pH 4.5); clear wavy boundary.

Bt—17 to 28 inches (42 to 70 centimeters); dark yellowish brown (10YR 4/4) extremely gravelly loam, light yellowish brown (10YR 6/4) dry; weak medium and coarse subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine and fine and common moderate and coarse roots; many very fine and fine irregular and common fine, medium, coarse, and very coarse tubular pores; very few faint clay films on faces of peds; 55 percent gravel and 5 percent cobbles; very strongly acid (pH 4.6); clear wavy boundary.

BC—28 to 40 inches (70 to 100 centimeters); yellowish brown (10YR 5/6) extremely gravelly loam, very pale brown (10YR 7/4) dry; weak medium and coarse subangular blocky structure; slightly hard, friable, slightly sticky and moderately plastic; common fine and medium roots; many very fine and fine irregular and common medium, coarse, and very coarse tubular pores; 50 percent gravel, 15 percent cobbles, and 1 percent stones; very strongly acid (pH 4.6); abrupt wavy boundary.

R—40 inches (100 centimeters); strongly cemented, fractured sandstone; fractures are mostly 4 to 18 inches (10 to 45 centimeters) apart.

Range in Characteristics

Depth to hard bedrock: 20 to 40 inches (50 to 100 centimeters)

Control section (by weighted average): 23 to 35 percent clay, 35 to 65 percent gravel, and 0 to 35 percent cobbles

Water table: None noted

Reaction: Moderately acid to very strongly acid

Surface fragments: 0 to 20 percent gravel and 0 to 10 percent cobbles

O horizon (where present)

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 7.5YR or 10YR

Value: 3 to 6 dry, 2 to 4 moist

Chroma: 3 or 4 dry, 2 to 4 moist

Texture of the fine-earth fraction: Loam

Content of clay: 23 to 27 percent

Rock fragments: 20 to 50 percent gravel and 0 to 5 percent cobbles

Bt horizon

Hue: 7.5YR or 10YR

Value: 5 to 7 dry, 3 to 5 moist

Chroma: 4 to 6 dry or moist

Texture of the fine-earth fraction: Loam or clay loam

Content of clay: 25 to 35 percent

Rock fragments: 30 to 65 percent gravel and 0 to 35 percent cobbles

C horizon (where present)

Hue: 7.5YR, 10YR, or 2.5Y

Value: 5 to 7 dry, 4 to 6 moist

Chroma: 4 to 6 dry or moist

Texture of the fine-earth fraction: Loam or clay loam

Content of clay: 20 to 35 percent

Rock fragments: 30 to 65 percent gravel, 5 to 35 percent cobbles, and 0 to 1 percent stones

Ladybird Series

Setting

Landscape position: Mountain slopes and ridgetops

Parent material: Colluvium and residuum derived from schist, sandstone, and mudstone

Slope: 15 to 75 percent

Elevation: 15 to 1,920 feet (5 to 586 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderately slow

Mean annual precipitation: 65 to 90 inches (1,650 to 2,290 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 250 to 300 days

Taxonomic classification: Fine-loamy, mixed, superactive, isomesic Typic Haplohumults

Modal Pedon

Ladybird gravelly loam, in an area of Ladybird-Stonehill complex, 30 to 50 percent slopes, on a concave, south-facing slope of 50 percent, under redwood, Sitka spruce, Douglas-fir, tanoak, and swordfern, at an elevation of 520 feet (158.5 meters); in Redwood National Park, Humboldt County, California; USGS Orick quadrangle; UTM zone 10, 413403mE, 4572996mN, NAD83.

Oi—0 to 1 inch (0 to 3 centimeters); fresh and slightly decomposed fern fronds, leaves, and twigs.

A1—1 to 5 inches (3 to 13 centimeters); very dark grayish brown (10YR 3/2) gravelly loam, brown (10YR 5/3) dry; weak very fine and moderate fine subangular blocky structure; hard, friable, slightly sticky and slightly plastic; many very fine and common fine, medium, and coarse roots; many very fine and fine irregular and tubular, common medium tubular, and few coarse tubular pores; 25 percent gravel; very strongly acid (pH 5.0); gradual smooth boundary.

A2—5 to 9 inches (13 to 24 centimeters); very dark grayish brown (10YR 3/2) gravelly clay loam, brown (10YR 5/3) dry; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine, medium, and coarse roots; many very fine, common fine and medium, and

- few coarse tubular pores; 33 percent gravel; very strongly acid (pH 4.9); gradual smooth boundary.
- BAt—9 to 24 inches (24 to 61 centimeters); very dark grayish brown (10YR 3/2) very gravelly silty clay loam, brown (10YR 5/3) dry; moderate medium and coarse subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine, medium, and coarse roots; common very fine, fine, and medium and few coarse tubular pores; 40 percent gravel; very strongly acid (pH 4.8); gradual smooth boundary.
- Bt1—24 to 31 inches (61 to 78 centimeters); brown (10YR 4/3) gravelly silty clay loam, pale brown (10YR 6/3) dry; moderate coarse subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine and fine, common medium, and few coarse roots; common very fine and fine and few medium tubular pores; few faint clay films in pores and on faces of peds; 20 percent gravel; very strongly acid (pH 4.8); gradual wavy boundary.
- Bt2—31 to 39 inches (78 to 99 centimeters); brown (10YR 4/3) gravelly clay loam, pale brown (10YR 6/3) dry; weak coarse subangular blocky structure; slightly hard, friable, moderately sticky and slightly plastic; few very fine, fine, medium, and coarse roots; common very fine and fine and few medium tubular pores; few faint clay films in pores and on faces of peds; 17 percent gravel; very strongly acid (pH 4.9); clear wavy boundary.
- Bt3—39 to 51 inches (99 to 130 centimeters); light olive brown (2.5Y 5/4) gravelly clay loam, pale yellow (2.5Y 7/4) dry; weak coarse subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine, fine, and medium roots; common very fine and few fine and medium tubular pores; few faint clay films in pores and on faces of peds; 24 percent gravel; very strongly acid (pH 4.9); gradual smooth boundary.
- BCt1—51 to 61 inches (130 to 155 centimeters); light olive brown (2.5Y 5/4) gravelly loam, pale yellow (2.5Y 7/4) dry; massive; soft, friable, slightly sticky and slightly plastic; few very fine and fine roots; few very fine and fine tubular pores; few faint clay films in pores and coating gravel; 30 percent gravel; very strongly acid (pH 4.9); gradual smooth boundary.
- BCt2—61 to 76 inches (155 to 193 centimeters); light olive brown (2.5Y 5/4) very gravelly loam, pale yellow (2.5Y 7/4) dry; massive; soft, friable, slightly sticky and slightly plastic; few very fine and fine roots; few very fine and fine tubular pores; very few faint clay films in pores and coating gravel; 34 percent gravel and 7 percent cobbles; very strongly acid (pH 4.9).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 25 to 35 percent clay and 15 to 35 percent gravel

Water table: None noted, except in map unit 532 at a depth of 47 to 60 inches (120 to 150 centimeters) in January and February

Reaction: Moderately acid to very strongly acid

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 10YR or 2.5Y

Value: 4 or 5 dry, 2 or 3 moist

Chroma: 2 to 4 dry, 2 or 3 moist
Texture of the fine-earth fraction: Loam or clay loam
Content of clay: 18 to 28 percent
Rock fragments: 15 to 35 percent gravel and 0 to 5 percent cobbles

Bt horizon

Hue: 10YR or 2.5Y
Value: 5 to 7 dry, 3 to 5 moist
Chroma: 3 to 6 dry, 2 to 6 moist
Texture of the fine-earth fraction: Loam, clay loam, or silty clay loam
Content of clay: 25 to 35 percent
Rock fragments: 15 to 35 percent gravel and 0 to 5 percent cobbles

C horizon

Hue: 10YR or 2.5Y
Value: 5 to 7 dry, 4 or 5 moist
Chroma: 4 to 6 dry, 3 to 6 moist
Texture of the fine-earth fraction: Loam or clay loam
Content of clay: 18 to 40 percent
Rock fragments: 5 to 55 percent gravel and 0 to 10 percent cobbles

Loleta Series

Setting

Landscape position: Alluvial fans and fan remnants
Parent material: Alluvium derived from mixed sources
Slope: 2 to 5 percent
Elevation: 5 to 160 feet (3 to 50 meters)
Depth class: Very deep
Drainage class: Poorly drained
Slowest saturated hydraulic conductivity: Moderately high
Slowest permeability: Moderately slow
Mean annual precipitation: 35 to 80 inches (890 to 2,030 millimeters)
Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)
Frost-free season: 275 to 330 days
Taxonomic classification: Fine-loamy, mixed, superactive, isomesic Fluvaquentic Endoaquolls

Modal Pedon

Loleta loam, in an area of Loleta, 2 to 5 percent slopes, on a slope of 2 percent, under pasture grasses and clover, at an elevation of 20 feet (6 meters); Humboldt County, California; USGS Ferndale quadrangle; UTM zone 10, 387146mE, 4492789mN, NAD83.

- Ap1—0 to 4 inches (0 to 10 centimeters); very dark grayish brown (10YR 3/2) loam, grayish brown (10YR 5/2) dry; strong fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine to medium roots; many very fine and fine tubular pores; 5 percent gravel; slightly acid (pH 6.5); clear wavy boundary.
- Ap2—4 to 14 inches (10 to 36 centimeters); very dark grayish brown (10YR 3/2) loam, grayish brown (10YR 5/2) dry; moderate coarse subangular blocky structure parting to moderate fine and medium subangular blocky; slightly hard, friable, slightly sticky and slightly plastic; many very fine and medium roots; few medium and common very fine and fine tubular pores; few fine distinct yellowish brown

(10YR 5/6) masses of iron accumulation; strongly acid (pH 5.5); clear wavy boundary.

Bg1—14 to 32 inches (36 to 81 centimeters); dark grayish brown (10YR 4/2) loam, light brownish gray (10YR 6/2) dry; weak medium and coarse subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few medium and common very fine and fine roots; many very fine and fine tubular pores; many medium distinct dark yellowish brown (10YR 4/6) masses of iron accumulation; moderately acid (pH 6.0); gradual wavy boundary.

Bg2—32 to 50 inches (81 to 127 centimeters); dark grayish brown (10YR 4/2) loam, light brownish gray (10YR 6/2) dry; massive; slightly hard, very friable, slightly sticky and slightly plastic; few very fine and fine roots; few very fine and fine tubular pores; many medium distinct dark yellowish brown (10YR 4/6) masses of iron accumulation; neutral (pH 7.0); gradual wavy boundary.

Bg3—50 to 68 inches (127 to 173 centimeters); grayish brown (10YR 5/2) fine sandy loam, light gray (10YR 7/2) dry; massive; slightly hard, very friable, slightly sticky and nonplastic; few very fine roots; few very fine tubular pores; many medium distinct dark yellowish brown (10YR 4/6) masses of iron accumulation; neutral (pH 7.0).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 18 to 27 percent clay and 0 to 3 percent gravel

Water table: At a depth of 4 to 10 inches (10 to 25 centimeters) in December through April, 10 to 40 inches (25 to 100 centimeters) in May, and greater than 72 inches (182 centimeters) in June through November

A or Ap horizon

Hue: 10YR or 2.5Y

Value: 4 or 5 dry, 2 or 3 moist

Chroma: 1 or 2 dry or moist

Texture of the fine-earth fraction: Loam

Content of clay: 15 to 25 percent

Rock fragments: 0 to 5 percent gravel

Reaction: Neutral to strongly acid

Redoximorphic features:

Type—fine and medium iron masses

Quantity—few to many

Hue—7.5YR or 10YR

Value—4 or 5

Chroma—4 to 6

Upper part of the Bg horizon

Hue: 10YR or 2.5Y

Value: 5 to 7 dry, 3 to 6 moist

Chroma: 1 or 2 dry or moist

Texture of the fine-earth fraction: Fine sandy loam, loam, silt loam

Content of clay: 15 to 27 percent

Rock fragments: 0 to 3 percent gravel

Reaction: Neutral to moderately acid

Redoximorphic features:

Type—fine to coarse iron masses

Quantity—common or many

Hue—10YR, 7.5YR, or 5YR

Value—4 or 5

Chroma—4 to 6

Lower part of the Bg horizon

Hue: 10YR, 2.5Y, or 5Y

Value: 5 to 7 dry, 3 to 6 moist

Chroma: 1 or 2 dry or moist

Content of clay: 15 to 35 percent

Texture of the fine-earth fraction: Loam, fine sandy loam, clay loam, silt loam, and silty clay loam

Rock fragments: 0 to 3 percent gravel

Reaction: Neutral to moderately acid

Redoximorphic features:

Type—fine to coarse iron masses

Quantity—common or many

Hue—7.5YR, 10YR, or 5Y

Value—4 or 5

Chroma—4 to 6

Maneze Series

Setting

Landscape position: Convex, upper mountains slopes and spur ridges

Parent material: Colluvium and residuum derived from sandstone and mudstone

Slope: 15 to 50 percent

Elevation: 515 to 3,160 feet (158 to 964 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately low

Slowest permeability: Moderately slow

Mean annual precipitation: 90 to 100 inches (2,290 to 2,550 millimeters)

Mean annual temperature: 50 to 59 degrees F (10 to 15 degrees C)

Frost-free season: 200 to 260 days

Taxonomic classification: Loamy-skeletal, mixed, superactive, mesic Humic Dystrocherepts

Modal Pedon

Maneze loam, in an area of Pasturerock-Coyoterock-Maneze complex, 30 to 50 percent slopes, on a convex, northwest-facing slope of 30 percent, under Oregon white oak, annual grasses, perennial grasses, and forbs, at an elevation of 2,450 feet (747 meters); in Redwood National Park, Humboldt County, California; USGS Bald Hills quadrangle; UTM zone 10, 424970mE, 4555792mN, NAD83.

Oi—0 to 1 inch (0 to 1 centimeter); slightly decomposed oak leaves and twigs.

A1—1 to 11 inches (1 to 29 centimeters); very dark brown (10YR 2/2) loam, dark gray (10YR 4/1) dry; weak medium subangular blocky structure parting to weak fine granular; soft, very friable, slightly sticky and slightly plastic; many very fine and common fine, medium, and coarse roots; many very fine and fine irregular and many very fine tubular pores; 8 percent gravel; strongly acid (pH 5.5); gradual smooth boundary.

A2—11 to 18 inches (29 to 46 centimeters); dark brown (10YR 3/3) extremely cobbly loam, grayish brown (10YR 5/2) dry; weak medium and coarse subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and fine and few medium roots; many very fine tubular and common very fine interstitial pores; 20 percent gravel and 60 percent cobbles; strongly acid (pH 5.5); abrupt wavy boundary.

Bw—18 to 29 inches (46 to 73 centimeters); olive brown (2.5Y 4/4) extremely cobbly clay loam, light yellowish brown (2.5Y 6/4) dry; weak coarse and very coarse subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; few very fine, fine, medium, and coarse roots; common very fine tubular and interstitial pores; 20 percent gravel and 50 percent cobbles; strongly acid (pH 5.5); clear wavy boundary.

BC—29 to 45 inches (73 to 113 centimeters); light olive brown (2.5Y 5/4) extremely cobbly clay loam, light yellowish brown (2.5Y 6/4) dry; massive; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine and few medium and coarse roots; common fine tubular, few medium tubular, and common very fine interstitial pores; 22 percent gravel and 50 percent cobbles; very strongly acid (pH 5.0); clear wavy boundary.

Cg—45 to 63 inches (113 to 161 centimeters); gray (N 6/0) very gravelly silty clay loam, light gray (5Y 7/1) dry; massive; hard, firm, slightly sticky and moderately plastic; common very fine and fine and few medium and coarse roots; common very fine and fine and few medium and coarse tubular pores; many fine and medium prominent strong brown (7.5YR 5/8) masses of iron accumulation, strong brown (7.5YR 5/8) moist; 50 percent gravel; very strongly acid (pH 4.5).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 22 to 32 percent clay, 18 to 45 percent gravel, and 20 to 60 percent cobbles

Water table: None noted within a depth of 40 inches (100 centimeters)

Reaction: Moderately acid or strongly acid

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Neutral to moderately acid

A horizon

Hue: 10YR or 2.5Y

Value: 4 or 5 dry, 2 or 3 moist

Chroma: 1 to 3 dry or moist

Texture of the fine-earth fraction: Loam

Content of clay: 22 to 26 percent

Rock fragments: 0 to 50 percent gravel and 0 to 60 percent cobbles

Bw horizon

Hue: 10YR or 2.5Y

Value: 5 to 7 dry, 3 to 5 moist

Chroma: 2 to 4 dry or moist

Texture of the fine-earth fraction: Loam, clay loam, or silty clay loam

Content of clay: 27 to 32 percent

Rock fragments: 18 to 45 percent gravel and 20 to 60 percent cobbles

Cg horizon

Hue: 2.5Y, 5Y, or neutral

Value: 4 to 7 dry, 4 to 6 moist

Chroma: Neutral to 2 dry or moist

Texture of the fine-earth fraction: Clay loam or silty clay loam

Content of clay: 28 to 35 percent

Rock fragments: 35 to 60 percent gravel and 0 to 60 percent cobbles

Redoximorphic features:

Type—fine and medium iron-manganese masses in the matrix; iron stains lining root channels and/or pores

Quantity—common or many

Hue—7.5YR, 10YR, or 2.5Y

Value—4 to 6 dry, 4 or 5 moist

Chroma—2 to 8 dry, 6 to 8 moist

C horizon (where present)

Hue: 10YR or 2.5Y

Value: 5 to 7 dry, 3 to 6 moist

Chroma: 2 to 4 dry or moist

Texture of the fine-earth fraction: Clay loam or silty clay loam

Content of clay: 22 to 30 percent

Rock fragments: 20 to 75 percent gravel and 0 to 50 percent cobbles

Mettah Series

Setting

Landscape position: Moderately broad ridges and upper mountain slopes

Parent material: Colluvium and residuum derived from weakly consolidated fluvial, beach, dune, and estuarine deposits (fig. 20)

Slope: 9 to 30 percent

Elevation: 970 to 2,260 feet (296 to 690 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately low

Slowest permeability: Slow

Mean annual precipitation: 70 to 90 inches (1,780 to 2,290 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 240 to 280 days

Taxonomic classification: Fine, parasquic, isomesic Andic Palehumults

Modal Pedon

Mettah clay loam, in an area of Surpur-Mettah complex, 9 to 30 percent slopes, on a slightly convex, west-facing slope of 10 percent, under redwood, Douglas-fir, tanoak, western hemlock, California huckleberry, Pacific rhododendron, and salal, at an elevation of 1,755 feet (535 meters); in Redwood National Park, Humboldt County, California; USGS Holter Ridge quadrangle; UTM zone 10, 420495mE, 4575555mN, NAD83.

Oi—0 to 1 inch (0 to 2 centimeters); fresh and slightly decomposed conifer needles, tanoak leaves, and twigs; abrupt smooth boundary.

A—1 to 9 inches (2 to 22 centimeters); dark brown (7.5YR 3/3) clay loam, light brown (7.5YR 6/3) dry; weak fine subangular blocky and weak medium granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine and common fine and medium roots; common very fine and fine irregular and many very fine and fine tubular pores; 13 percent well rounded pebbles; moderately acid (pH 5.6); clear smooth boundary.

BAt—9 to 17 inches (22 to 42 centimeters); brown (7.5YR 4/4) silty clay loam, light brown (7.5YR 6/3) dry; weak fine subangular blocky and moderate medium granular structure; soft, very friable, slightly sticky and slightly plastic; common very fine and fine and few medium roots; common very fine and fine irregular

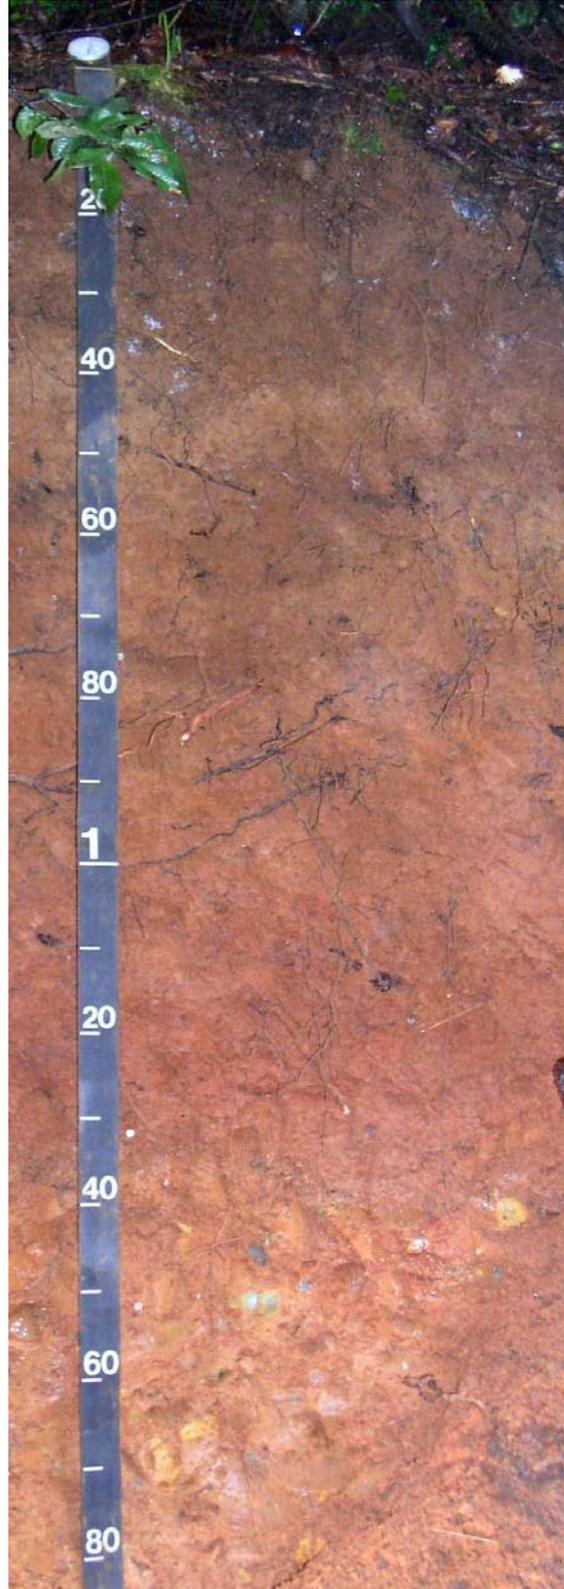

Figure 20.—A profile of a Mettah soil. These soils are on Holter Ridge. They form in fine sediments of the Prairie Creek Formation. Depth is marked in centimeters.

and common very fine and fine tubular pores; 10 percent well rounded pebbles; moderately acid (pH 5.8); clear smooth boundary.

Bt1—17 to 27 inches (42 to 69 centimeters); reddish brown (5YR 4/4) silty clay, strong brown (7.5YR 4/6) dry; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; common very fine and fine and few medium roots; common very fine and fine tubular pores; few faint distinct clay films on faces of peds; 5 percent well rounded pebbles; strongly acid (pH 5.4); clear smooth boundary.

Bt2—27 to 37 inches (69 to 93 centimeters); yellowish red (5YR 4/6) clay, reddish yellow (7.5YR 6/6) dry; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; common very fine and fine and few medium and coarse roots; common very fine and fine tubular pores; common distinct clay films in pores and on faces of peds; 3 percent well rounded pebbles; strongly acid (pH 5.4); clear smooth boundary.

Bt3—37 to 48 inches (93 to 123 centimeters); red (2.5YR 4/8) clay, reddish yellow (5YR 6/8) dry; moderate fine and medium subangular blocky structure; moderately hard, firm, moderately sticky and very plastic; few very fine and common fine and medium roots; common very fine and fine tubular pores; many distinct clay films in pores and on faces of peds; 1 percent well rounded pebbles; strongly acid (pH 5.2); clear wavy boundary.

Bt4—48 to 52 inches (123 to 131 centimeters); red (2.5YR 4/8) clay, red (2.5YR 5/8) dry; moderate fine and medium subangular blocky structure; moderately hard, firm, moderately sticky and very plastic; few very fine and fine and common medium roots; common very fine and fine tubular pores; many distinct clay films in pores and on faces of peds; 1 percent well rounded pebbles; strongly acid (pH 5.2); clear wavy boundary.

Bt5—52 to 58 inches (131 to 148 centimeters); red (2.5YR 5/8) clay, reddish yellow (5YR 6/8) dry; moderate fine and medium subangular blocky structure; moderately hard, firm, moderately sticky and very plastic; few fine and medium roots; few very fine and fine tubular pores; many distinct clay films in pores and on faces of peds; 3 percent well rounded pebbles; strongly acid (pH 5.2); gradual wavy boundary.

Bt6—58 to 79 inches (148 to 200 centimeters); red (2.5YR 5/8) clay loam, reddish yellow (5YR 6/8) dry; weak medium and coarse subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; few fine roots; few very fine and fine irregular pores; many distinct clay films in pores and on faces of peds; 3 percent well rounded pebbles; very strongly acid (pH 5.0).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 40 to 60 percent clay and 0 to 15 percent gravel

Water table: None noted

Reaction: Moderately acid or strongly acid

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 5YR, 7.5YR, or 10YR

Value: 4 to 6 dry, 3 or 4 moist

Chroma: 3 to 6 dry or moist
Texture of the fine-earth fraction: Clay loam
Content of clay: 27 to 35 percent
Rock fragments: 0 to 15 percent gravel

Bt horizon (upper part):

Hue: 2.5YR, 5YR, or 7.5YR
Value: 5 or 6 dry, 3 to 6 moist
Chroma: 4 to 8 dry or moist
Texture of the fine-earth fraction: Silty clay or clay
Content of clay: 40 to 60 percent
Rock fragments: 0 to 15 percent gravel

Bt horizon (lower part):

Hue: 2.5YR, 5YR, or 7.5YR
Value: 5 or 6 dry, 3 to 6 moist
Chroma: 4 to 8 dry or moist
Texture of the fine-earth fraction: Clay loam, silty clay loam, or clay
Content of clay: 32 to 45 percent
Rock fragments: 0 to 30 percent gravel and 0 to 5 percent cobbles

Mooncreek Series

Setting

Landscape position: Mountain slopes and ridges
Parent material: Colluvium and residuum derived from sandstone and mudstone
Slope: 9 to 75 percent
Elevation: 45 to 4,985 feet (15 to 1,520 meters)
Depth class: Very deep
Drainage class: Well drained
Slowest saturated hydraulic conductivity: Moderately high
Slowest permeability: Moderately slow
Mean annual precipitation: 49 to 80 inches (1,250 to 2,030 millimeters)
Mean annual temperature: 50 to 59 degrees F (10 to 15 degrees C)
Frost-free season: 150 to 250 days
Taxonomic classification: Fine-loamy, mixed, active, mesic Typic Palexerults

Modal Pedon

Mooncreek gravelly loam, in an area of Mooncreek-Tossup-Noisy complex, 15 to 50 percent slopes, on a linear, northeast-facing slope of 35 percent, under Douglas-fir, tanoak, Pacific madrone, and salal, at an elevation of 3,245 feet (990 meters); Humboldt County, California; USGS Hupa Mountain quadrangle; UTM zone 10, 434516mE, 4543297mN, NAD83.

Oi—0 to 2 inches (0 to 4 centimeters); very dark gray (10YR 3/1) slightly decomposed plant material consisting of needles and leaves of Douglas-fir and tanoak, black (10YR 2/1) moist; about 100 percent fiber unrubbed, 80 percent rubbed; loose, nonsticky and nonplastic; common very fine roots; common fine irregular pores; moderately acid (pH 5.6); abrupt smooth boundary.

A—2 to 3 inches (4 to 8 centimeters); brown (7.5YR 5/4) gravelly loam, dark brown (7.5YR 3/4) moist; moderate fine granular structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine to medium roots; many very fine and fine tubular and many medium interstitial pores; 18 percent gravel; very strongly acid (pH 4.7); clear smooth boundary.

Soil Survey of Redwood National and State Parks, California

- ABt—3 to 6 inches (8 to 16 centimeters); brown (7.5YR 5/4) gravelly loam, dark brown (7.5YR 3/4) moist; moderate fine subangular blocky structure; slightly hard, very friable, moderately sticky and moderately plastic; many very fine to medium roots; many fine and medium and common coarse tubular pores; few faint clay films on all faces of peds; 18 percent gravel; very strongly acid (pH 5.0); clear smooth boundary.
- Bt1—6 to 21 inches (16 to 54 centimeters); yellowish brown (10YR 5/4) gravelly clay loam, dark yellowish brown (10YR 4/4) moist; strong fine and medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; many fine and medium and common coarse roots; many fine and medium and common coarse tubular pores; few distinct clay films on all faces of peds; 18 percent gravel; extremely acid (pH 4.4); clear smooth boundary.
- Bt2—21 to 38 inches (54 to 96 centimeters); yellowish brown (10YR 5/4) gravelly silty clay loam, dark yellowish brown (10YR 4/6) moist; moderate fine and medium angular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; many fine and medium and common coarse roots; many fine and medium tubular pores; common distinct clay films on all faces of peds; 20 percent gravel; extremely acid (pH 4.4); gradual smooth boundary.
- Bt3—38 to 55 inches (96 to 139 centimeters); yellowish brown (10YR 5/4) gravelly silty clay loam, dark yellowish brown (10YR 4/6) moist; moderate fine and medium angular blocky structure; hard, firm, very sticky and very plastic; common medium and coarse roots; common fine and medium tubular pores; common distinct clay films on all faces of peds; common fine very weakly cemented iron-manganese masses, strong brown (7.5YR 5/6) moist; 18 percent gravel; very strongly acid (pH 5.0); gradual smooth boundary.
- Bt4—55 to 80 inches (139 to 200 centimeters); light yellowish brown (10YR 6/4) gravelly silty clay loam, yellowish brown (10YR 5/6) moist; moderate medium and moderate fine subangular blocky structure; hard, firm, very sticky and very plastic; common medium and common coarse roots; common medium tubular pores; common distinct clay films on all faces of peds; common fine very weakly cemented iron-manganese masses, strong brown (7.5YR 5/6) moist; 16 percent gravel; very strongly acid (pH 4.5).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 25 to 35 percent clay, 0 to 25 percent gravel, and 0 to 10 percent cobbles

Water table: None noted

Reaction: Moderately acid to very strongly acid

Surface fragments: 0 to 5 percent gravel and 0 to 2 percent cobbles

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 7.5YR or 10YR

Value: 4 or 5 dry, 3 or 4 moist

Chroma: 3 or 4 dry or moist

Texture of the fine-earth fraction: Loam

Content of clay: 16 to 27 percent

Rock fragments: 15 to 50 percent gravel and 0 to 10 percent cobbles

Upper part of the Bt horizon

Hue: 7.5YR or 10YR

Value: 4 to 6 dry, 4 or 5 moist

Chroma: 4 to 6 dry or moist

Texture of the fine-earth fraction: Loam, silty clay loam, or clay loam

Content of clay: 23 to 35 percent

Rock fragments: 0 to 25 percent gravel and 0 to 25 percent cobbles

Lower part of the Bt horizon

Hue: 7.5YR or 10YR

Value: 4 to 6 dry, 4 or 5 moist

Chroma: 4 to 6 dry or moist

Texture of the fine-earth fraction: Silty clay loam or clay loam

Content of clay: 30 to 40 percent

Rock fragments: 0 to 35 percent gravel

Pararock fragments: 0 to 50 percent paragravel and 0 to 10 percent paracobble

Mudhorse Series

Setting

Landscape position: Mountain slopes

Parent material: Colluvium and residuum derived from sandstone and mudstone

Slope: 30 to 50 percent

Elevation: 110 to 3,900 feet (35 to 1,190 meters)

Depth class: Very deep

Drainage class: Moderately well drained

Slowest saturated hydraulic conductivity: Moderately low

Slowest permeability: Slow

Mean annual precipitation: 49 to 80 inches (1,250 to 2,030 millimeters)

Mean annual temperature: 50 to 59 degrees F (10 to 15 degrees C)

Frost-free season: 150 to 250 days

Taxonomic classification: Fine-loamy, mixed, active, mesic Oxyaquic Palehumults

Modal Pedon

Mudhorse gravelly loam, in an area of Higoaks-Noisy-Mudhorse complex, 9 to 50 percent slopes, on strongly concave, west-facing slope of 35 percent, under a stand of Oregon white oak, California black oak, annual grasses, and perennial grasses, at an elevation of 3,500 feet (1,100 meters); Humboldt County, California; USGS Grouse Mountain quadrangle; UTM zone 10, 438084mE, 4520554mN, NAD83.

Oi—0 to 2 inches (0 to 4 centimeters); very dark gray (10YR 3/1) slightly decomposed plant material consisting of needles and leaves of Oregon white oak, black (10YR 2/1) moist; about 100 percent fiber unrubbed, 80 percent rubbed; few very fine roots; many fine irregular pores; moderately acid (pH 5.6); abrupt smooth boundary.

A—2 to 5 inches (4 to 12 centimeters); brown (10YR 4/3) gravelly loam, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure parting to moderate fine granular; soft, very friable, nonsticky and nonplastic; many very fine to medium roots; many very fine and fine tubular pores; 20 percent gravel; moderately acid (pH 5.6); clear smooth boundary.

Bt1—5 to 12 inches (12 to 30 centimeters); dark yellowish brown (10YR 4/4) loam, brown (10YR 4/3) moist; strong fine subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; many fine and medium roots; many very fine to medium tubular pores; common faint clay films on all faces of peds; 5 percent gravel; strongly acid (pH5.4); clear wavy boundary.

- Bt2—12 to 20 inches (30 to 51 centimeters); olive brown (2.5Y 4/4) clay loam, olive brown (2.5Y 4/4) moist; strong fine angular blocky structure; hard, firm, very sticky and very plastic; many fine and common medium roots; many very fine and common fine and coarse tubular pores; common faint clay films on all faces of peds; 5 percent gravel; strongly acid (pH 5.4); clear wavy boundary.
- Btg1—20 to 32 inches (51 to 82 centimeters); dark grayish brown (2.5Y 4/2) clay, very dark grayish brown (2.5Y 3/2) moist; strong fine and medium angular blocky structure; very hard, very firm, very sticky and very plastic; many fine and medium and common coarse roots; many medium and coarse tubular pores; few distinct clay films on all faces of peds; 40 percent fine very weakly cemented yellowish red (5YR 4/6) iron-manganese masses; 5 percent gravel; strongly acid (pH 5.4); clear wavy boundary.
- Btg2—32 to 51 inches (82 to 130 centimeters); very dark gray (2.5Y 3/1) clay, very dark gray (2.5Y 3/1) moist; moderate medium and coarse subangular blocky structure parting to strong very fine angular blocky; very hard, very firm, very sticky and very plastic; many fine and medium tubular pores; few distinct clay films on all faces of peds; 40 percent fine extremely weakly cemented yellowish red (5YR 4/6) iron-manganese masses; 5 percent gravel; strongly acid (pH 5.2); gradual wavy boundary.
- Btg3—51 to 79 inches (130 to 200 centimeters); very dark gray (2.5Y 3/1) clay, very dark gray (2.5Y 3/1) moist; moderate medium and coarse subangular blocky structure parting to strong very fine angular blocky; very hard, very firm, very sticky and very plastic; many fine roots; many medium tubular pores; few distinct clay films on all faces of peds; 60 percent fine very weakly cemented yellowish red (5YR 4/6) iron-manganese masses; 5 percent gravel; strongly acid (pH 5.2).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 20 to 35 percent clay and 0 to 15 percent gravel

Water table: At a depth of 20 to 40 inches (50 to 100 centimeters) January through March

Surface fragments: 0 to 5 percent gravel

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 10YR or 2.5Y

Value: 3 or 4 dry or moist

Chroma: 2 or 3 dry or more

Texture of the fine-earth fraction: Loam

Content of clay: 12 to 25 percent

Rock fragments: 15 to 25 percent gravel

Reaction: Moderately acid to very strongly acid

Bt horizon

Hue: 10YR, 2.5Y, or 5Y

Value: 3 to 5 dry or moist

Chroma: 2 to 4 dry or moist

Texture of the fine-earth fraction: Loam or clay loam

Content of clay: 20 to 35 percent
Rock fragments: 0 to 15 percent gravel
Reaction: Moderately acid to very strongly acid

Btg horizon

Hue: 10YR, 2.5Y, or 5Y
Value: 3 to 5 dry or moist
Chroma: 1 or 2 dry or moist
Texture of the fine-earth fraction: Clay
Content of clay: 35 to 50 percent
Rock fragments: 0 to 15 percent gravel
Reaction: Strongly acid or very strongly acid
Redoximorphic features (where present):
 Type—fine to coarse weakly cemented iron-manganese masses in the matrix
 Quantity—few to many
 Hue—7.5YR, 10YR, or 2.5YR
 Value—3 to 5 moist
 Chroma—3 to 6 moist

Mystery Series

Setting

Landscape position: Alluvial fans, low terraces, and fan remnants
Parent material: Alluvium derived from mixed sources (fig. 21)
Slope: 2 to 9 percent
Elevation: 5 to 670 feet (2 to 205 meters)
Depth class: Very deep
Drainage class: Moderately well drained
Slowest saturated hydraulic conductivity: Moderately high
Slowest permeability: Moderate
Flooding: Occasional
Mean annual precipitation: 60 to 75 inches (1,520 to 1,900 millimeters)
Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)
Frost-free season: 300 to 320 days
Taxonomic classification: Coarse-loamy, mixed, superactive, isomesic Oxyaquic
 Eutrudepts

Modal Pedon

Mystery fine sandy loam, in an area of Bigtree-Mystery complex, 2 to 9 percent slopes, on a gentle, north-facing slope of 2 percent, under redwood, tanoak, California huckleberry, cascara, swordfern, and redwood-sorrel, at an elevation of 100 feet (30 meters); in Jedediah Smith Redwoods State Park, Del Norte County, California; USGS Hiouchi quadrangle; UTM zone 10, 410091mE, 4627143mN, NAD83.

Oi—0 to 1 inch (0 to 3 centimeters); black (10YR 2/1) slightly decomposed needles, leaves, and twigs, very dark grayish brown (10YR 3/2) dry; 95 percent fiber unrubbed, 85 percent rubbed; loose, loose, nonsticky and nonplastic; many very fine and fine and common medium roots; many very fine and fine interstitial pores; 15 percent wood fragments; very strongly acid (pH 5.0); clear smooth boundary.
A1—1 to 11 inches (3 to 29 centimeters); dark olive gray (5Y 3/2) fine sandy loam, light olive gray (5Y 6/2) dry; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common fine, medium, and coarse roots; common very fine tubular and interstitial pores; strongly acid (5.5 pH); abrupt smooth boundary.

Figure 21.—A profile of a Mystery soil. These soils form in overbank flood deposits. This profile exhibits two features that may be buried surfaces (at depths of about 30 and 100 centimeters). Depth is marked in centimeters.

2A2—11 to 17 inches (29 to 43 centimeters); very dark grayish brown (2.5Y 3/2) very fine sandy loam, grayish brown (2.5Y 5/2) dry; moderate very fine and fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many fine and common very fine, medium, and coarse roots; common very fine and fine tubular and interstitial pores; strongly acid (5.5 pH); clear smooth boundary.

- 2A3—17 to 24 inches (43 to 60 centimeters); very dark grayish brown (2.5Y 3/2) very fine sandy loam, grayish brown (2.5Y 5/2) dry; moderate very fine and fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many medium and common very fine, fine, and coarse roots; common very fine and fine tubular and interstitial pores; moderately acid (6.0 pH); clear wavy boundary.
- 2C—24 to 30 inches (60 to 77 centimeters); dark grayish brown (2.5Y 4/2) fine sandy loam, light brownish gray (2.5Y 6/2) dry; massive; slightly hard, friable, slightly sticky and slightly plastic; many medium, common fine and coarse, and moderately few very fine roots; common very fine tubular and interstitial pores; moderately acid (6.0 pH); clear smooth boundary.
- 3Bwb1—30 to 36 inches (77 to 92 centimeters); olive brown (2.5Y 4/3) very fine sandy loam, light olive brown (2.5Y 5/4) dry; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many medium and common very fine and fine roots; common very fine and fine tubular and interstitial pores; many very fine and fine distinct yellowish brown (10YR 5/6) masses of iron accumulation throughout the matrix; common fine distinct iron depletions throughout matrix, gray (10YR 5/1) moist; moderately acid (6.0 pH); clear smooth boundary.
- 3Bwb2—36 to 41 inches (92 to 104 centimeters); olive brown (2.5Y 4/3) very fine sandy loam, light olive brown (2.5Y 5/4) dry; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common fine and medium and moderately few very fine roots; common very fine tubular and interstitial pores; common very fine and fine distinct yellowish brown (10YR 5/6) masses of iron accumulation throughout the matrix; few very fine distinct iron depletions throughout the matrix, gray (10YR 5/1) moist; moderately acid (6.0 pH); clear smooth boundary.
- 4Ab—41 to 60 inches (104 to 152 centimeters); dark grayish brown (2.5Y 4/2) silt loam, light yellowish brown (2.5Y 6/3) dry; moderate fine and weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine and moderately few medium roots; common very fine tubular and common very fine and fine interstitial pores; few very fine and fine distinct yellowish brown (10YR 5/6) masses of iron accumulation along root channels; few very fine distinct iron depletions along root channels, gray (10YR 5/1) moist; moderately acid (6.0 pH).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 10 to 16 percent clay, 0 to 15 percent gravel, 0 to 5 percent cobbles, and 0 to 2 percent stones

Water table: At a depth of 30 to 40 inches (77 to 100 centimeters) January through April

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 5Y, 2.5Y, or 10YR

Value: 3 to 6 dry, 2 to 4 moist

Chroma: 1 to 4 dry or moist

Texture of the fine-earth fraction: Very fine sandy loam and fine sandy loam

Content of clay: 10 to 20 percent

Rock fragments: 0 to 15 percent gravel

Reaction: Moderately acid or strongly acid

Bw horizon

Hue: 2.5Y, 10YR, or 7.5YR

Value: 4 to 7 dry, 2 to 5 moist

Chroma: 2 to 6 dry, 2 to 4 moist

Texture of the fine-earth fraction: Coarse sandy loam, fine sandy loam, very fine sandy loam, or sandy loam

Content of clay: 5 to 20 percent

Rock fragments: 0 to 15 percent gravel, 0 to 5 percent cobbles, and 0 to 2 percent stones

Reaction: Moderately acid or strongly acid

Redoximorphic features:

Type—very fine, fine, and medium masses of iron accumulation and iron depletions in the matrix or along root channels

Quantity—many, common, or few

Hue—7.5YR, 10YR, or 2.5Y

Value—4 to 6 moist

Chroma—1 to 8 moist

C horizon (including buried A horizons):

Hue: 2.5Y or 10YR

Value: 4 to 7 dry, 2 to 6 moist

Chroma: 2 to 4 dry or moist

Texture of the fine-earth fraction: Stratified coarse sand through silt loam

Content of clay: 0 to 22 percent

Rock fragments: 0 to 15 percent gravel, 0 to 5 percent cobbles, and 0 to 5 percent stones

Reaction: Moderately acid or strongly acid

Noisy Series

Setting

Landscape position: Mountain slopes and ridges

Parent material: Colluvium and residuum derived from sandstone and mudstone

Slope: 9 to 75 percent

Elevation: 45 to 4,985 feet (15 to 1,520 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderately slow or moderate

Mean annual precipitation: 49 to 80 inches (1,250 to 2,030 millimeters)

Mean annual temperature: 50 to 59 degrees F (10 to 15 degrees C)

Frost-free season: 150 to 250 days

Taxonomic classification: Loamy-skeletal, mixed, active, mesic Typic Haploxerults

Modal Pedon

Noisy very gravelly loam, in an area of Mooncreek-Tossup-Noisy complex, 15 to 50 percent slopes, on a convex, east-facing slope of 48 percent, under Douglas-fir, tanoak, Pacific madrone, and salal, at an elevation of 278 feet (850 meters); Humboldt County, California; USGS French Camp Ridge quadrangle; UTM zone 10, 430791mE, 4553476mN, NAD83.

- Oi—0 to 2 inches (0 to 4 centimeters); very dark gray (10YR 3/1) slightly decomposed plant material consisting of needles and leaves of Douglas-fir and tanoak, black (10YR 2/1) moist; about 100 percent fiber unrubbed, 80 percent rubbed; loose, nonsticky and nonplastic; many very fine roots; common fine irregular pores; moderately acid (pH 5.6); abrupt smooth boundary.
- A—2 to 5 inches (4 to 13 centimeters); brown (10YR 4/3) very gravelly loam, dark brown (10YR 3/3) moist; moderate fine and medium subangular blocky structure parting to weak very fine subangular blocky; soft, very friable, slightly sticky and slightly plastic; many very fine and fine and common medium roots; many very fine and medium tubular pores; 50 percent gravel; very strongly acid (pH 5.0); clear smooth boundary.
- Bt1—5 to 10 inches (13 to 25 centimeters); brownish yellow (10YR 6/6) extremely gravelly loam, yellowish brown (10YR 5/4) moist; moderate fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine and common coarse roots; many very fine and common medium tubular pores; common distinct clay films on all faces of peds; 60 percent gravel; very strongly acid (pH 4.8); clear wavy boundary.
- Bt2—10 to 31 inches (25 to 80 centimeters); brownish yellow (10YR 6/6) very gravelly clay loam, yellowish brown (10YR 5/4) moist; moderate fine subangular blocky structure; soft, very friable, moderately sticky and moderately plastic; many very fine and fine and common coarse roots; common fine and medium tubular pores; few distinct clay films on all faces of peds; 40 percent gravel and 20 percent paragravel; very strongly acid (pH 4.8); gradual wavy boundary.
- BCt1—31 to 51 inches (80 to 130 centimeters); brownish yellow (10YR 6/6) extremely gravelly sandy clay loam, yellowish brown (10YR 5/4) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine and common medium and coarse roots; common fine and medium tubular pores; few distinct clay films on all faces of peds; 70 percent gravel and 10 percent paragravel; very strongly acid (pH 4.6); gradual wavy boundary.
- BCt2—51 to 61 inches (130 to 154 centimeters); brownish yellow (10YR 6/6) very gravelly sandy clay loam, yellowish brown (10YR 5/4) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common medium and coarse roots; common fine and medium tubular pores; few distinct clay films on all faces of peds; 50 percent gravel and 30 percent paragravel; very strongly acid (pH 4.6).

Range in Characteristics

Depth to fractured bedrock: 20 to 40 inches (50 to 100 centimeters)

Control section (by weighted average): 18 to 35 percent clay, 35 to 75 percent gravel, and 0 to 45 percent cobbles

Water table: None noted

Surface fragments: 0 to 5 percent gravel

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 10YR or 2.5Y

Value: 3 to 6 dry, 3 or 4 moist

Chroma: 3 or 4 dry or moist

Texture of the fine-earth fraction: Loam

Content of clay: 12 to 26 percent

Rock fragments: 15 to 55 percent gravel and 0 to 10 percent cobbles

Reaction: Neutral to very strongly acid

Bt horizon

Hue: 10YR or 2.5Y

Value: 4 to 6 dry, 3 to 5 moist

Chroma: 4 to 6 dry, 3 to 6 moist

Texture of the fine-earth fraction: Sandy clay loam, loam, clay loam, or silty clay loam

Content of clay: 18 to 35 percent

Rock fragments: 35 to 75 percent gravel, 0 to 45 percent cobbles, and 0 to 30 percent paragravel

Reaction: Moderately acid to very strongly acid

C horizon (where present)

Hue: 10YR or 2.5Y

Value: 4 to 6 dry, 3 to 5 moist

Chroma: 4 to 6 dry, 3 to 6 moist

Texture of the fine-earth fraction: Loam or silty clay loam

Content of clay: 20 to 35 percent

Rock fragments: 75 to 85 percent gravel

Reaction: Strongly acid or very strongly acid

Oakside Series

Setting

Landscape position: Mountain slopes

Parent material: Colluvium and residuum derived from sandstone

Slope: 50 to 100 percent

Elevation: 65 to 4,755 feet (20 to 1,450 meters)

Depth class: Shallow

Drainage class: Somewhat excessively drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderate

Mean annual precipitation: 49 to 80 inches (1,250 to 2,030 millimeters)

Mean annual temperature: 50 to 59 degrees F (10 to 15 degrees C)

Frost-free season: 150 to 250 days

Taxonomic classification: Loamy-skeletal, mixed, superactive, mesic Lithic Haploxerolls

Modal Pedon

Oakside extremely gravelly loam, in an area of Sidehill-Oakside-Darkwoods complex, 50 to 100 percent slopes, on a linear, east-facing slope of 65 percent, under tree cover of canyon live oak, tanoak, Douglas-fir, and Pacific madrone, at an elevation of 3,600 feet (1,100 meters); Humboldt County, California; USGS Hupa Mountain quadrangle; UTM zone 10, 434946mE, 4541021mN, NAD83.

Oi—0 to 2 inches (0 to 6 centimeters); slightly decomposed tanoak leaves and Douglas-fir cones, very dark brown (10YR 2/2) rubbed and very dark grayish brown (10YR 3/2) dry; 100 percent fibers unrubbed, 10 percent fibers rubbed; abrupt smooth boundary.

A1—2 to 6 inches (6 to 16 centimeters); dark brown (10YR 3/3) extremely gravelly loam, very dark brown (10YR 2/2) moist; moderate fine subangular blocky structure parting to moderate very fine granular; soft, very friable, nonsticky and

nonplastic; many very fine and fine roots; many very fine and fine tubular pores; 80 percent gravel and 5 percent cobbles; slightly acid (pH 6.2); clear wavy boundary.
A2—6 to 10 inches (16 to 26 centimeters); dark yellowish brown (10YR 4/4) extremely cobbly loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine to medium roots; many fine and medium tubular pores; 10 percent gravel and 55 percent cobbles; moderately acid (pH 5.6); abrupt irregular boundary.
R—10 to 59 inches (26 to 150 centimeters); indurated sandstone.

Range in Characteristics

Depth to hard bedrock: 10 to 20 inches (25 to 50 centimeters)

Control section (by weighted average): 10 to 18 percent clay, 35 to 65 percent gravel, and 5 to 55 percent cobbles

Water table: None noted

Reaction: Slightly acid or moderately acid

Surface fragments: 25 to 75 percent gravel

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Neutral to moderately acid

A horizon

Hue: 10YR

Value: 3 to 5 dry, 2 to 5 moist

Chroma: 2 to 6 dry, 2 or 3 moist

Texture of the fine-earth fraction: Loam

Content of clay: 10 to 18 percent

Rock fragments: 10 to 80 percent gravel and 5 to 55 percent cobbles

Oragran Series

Setting

Landscape position: Mountain slopes and ridges

Parent material: Residuum and colluvium derived from serpentinized peridotite

Slope: 9 to 75 percent

Elevation: 180 to 3,010 feet (55 to 918 meters)

Depth class: Shallow

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately high to moderately low

Slowest permeability: Moderate to slow

Mean annual precipitation: 90 to 120 inches (2,290 to 3,050 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 100 to 180 days

Taxonomic classification: Loamy, magnesian, mesic Lithic Haploxerepts

Modal Pedon

Oragran very stony loam, in an area of Jayel-Walnett-Oragran complex, 9 to 30 percent slopes, extremely stony, on an east-facing slope of 10 percent, under knobcone pine, lodgepole pine, azalea, huckleberry oak, and red huckleberry, at an elevation of 4,060 feet (1,237 meters); in Six Rivers National Forest, Del Norte County,

Soil Survey of Redwood National and State Parks, California

California; USGS Klamath Glen, California, quadrangle; SW¹/₄NW¹/₄ sec. 13, T. 13 N., R. 2 E., Humboldt Base Meridian.

Oi—0 to 1 inch (0 to 2 centimeters); fresh and decomposing leaf and needle litter; strongly acid (pH 5.3).

A—1 to 3 inches (2 to 8 centimeters); yellowish brown (10YR 5/4) very stony loam, dark brown (10YR 4/3) moist; moderate very fine granular structure; soft, friable, nonsticky and nonplastic; few very fine, common fine, and few medium roots; many very fine interstitial and tubular pores; 15 percent gravel and 30 percent stones; moderately acid (pH 5.8); clear smooth boundary.

Bw—3 to 13 inches (8 to 33 centimeters); brownish yellow (10YR 6/6) stony silt loam, yellowish brown (10YR 5/6) moist; weak very fine subangular blocky structure; slightly hard, firm, slightly sticky and slightly plastic; few very fine, fine, medium, and coarse roots; many very fine interstitial and tubular pores; 15 percent stones; moderately acid (pH 6.0); abrupt irregular boundary.

R—13 inches (33 centimeters); fractured serpentinitized peridotite; fractures 8 to 20 inches (20 to 50 centimeters) apart.

Range in Characteristics

Depth to hard bedrock: 10 to 20 inches (25 to 50 centimeters)

Control section (by weighted average): 23 to 35 percent clay and 10 to 35 percent rock fragments

Water table: None noted

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Content of clay: 0 to 5 percent

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 7.5YR or 10YR

Value: 5 to 7 dry, 4 or 5 moist

Chroma: 3 to 6 dry or moist

Texture of the fine-earth fraction: Loam

Content of clay: 20 to 27 percent

Rock fragments: 10 to 20 percent gravel and 25 to 30 percent stones

Reaction: Slightly acid or moderately acid

Bw horizon

Hue: 10YR or 2.5Y

Value: 6 or 7 dry, 5 or 6 moist

Chroma: 3 to 8 dry, 6 moist

Texture of the fine-earth fraction: Loam, silt loam, or clay loam

Content of clay: 15 to 35 percent

Rock fragments: 0 to 25 percent gravel and 15 to 20 percent stones

Reaction: Slightly acid or moderately acid

Ossagon Series

Setting

Landscape position: Hillslopes, mountain slopes, and broad ridges

Parent material: Colluvium and residuum from weakly consolidated fluvial, beach, and dune deposits derived from mixed sources

Soil Survey of Redwood National and State Parks, California

Slope: 9 to 50 percent

Elevation: 15 to 1,945 feet (6 to 593 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderately slow or moderate

Mean annual precipitation: 60 to 90 inches (1,520 to 2,290 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 240 to 325 days

Taxonomic classification: Fine-loamy, mixed, superactive, isomesic Typic
Haplohumults

Modal Pedon

Ossagon loam, in an area of Ossagon-Squashan complex, 9 to 30 percent slopes, on a slightly convex, northwest-facing slope of 24 percent, under redwood, Sitka spruce, red alder, cascara, western hemlock, California blackberry, salmonberry, salal, California huckleberry, swordfern, and deer fern, at an elevation of 180 feet (55 meters); in Redwood National Park, Humboldt County, California; USGS Orick quadrangle; UTM zone 10, 414728mE, 4577846mN, NAD83.

Oi—0 to 4 inches (0 to 10 centimeters); fresh and slightly decomposed conifer needles, alder leaves and twigs, and mosses and fungus; clear smooth boundary.

A—4 to 12 inches (10 to 31 centimeters); very dark brown (10YR 2/2) loam, dark grayish brown (10YR 4/2) dry; weak fine and medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine and common medium roots; common very fine and common fine interstitial and common very fine and fine and few medium tubular pores; moderately acid (pH 6.0); clear wavy boundary.

AB—12 to 16 inches (31 to 41 centimeters); brown (10YR 4/3) clay loam, yellowish brown (10YR 5/4) dry; weak medium and coarse subangular blocky structure; slightly hard, friable, slightly sticky and moderately plastic; common very fine, fine, medium, and coarse roots; common very fine and fine and few medium tubular pores; moderately acid (pH 6.0); clear wavy boundary.

BAt—16 to 29 inches (41 to 73 centimeters); strong brown (7.5YR 4/6) loam, brownish yellow (10YR 6/6) dry; weak coarse subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and fine and few medium and coarse roots; common very fine and fine and few medium tubular pores; common faint clay films on faces of peds; moderately acid (pH 6.0); gradual wavy boundary.

Bt—29 to 48 inches (73 to 121 centimeters); brown (7.5YR 4/4) clay loam, brownish yellow (10YR 6/6) dry; weak coarse and very coarse subangular blocky structure; moderately hard, friable, slightly sticky and slightly plastic; common very fine and fine and few medium and coarse roots; common very fine and fine and few medium tubular pores; common distinct clay films on surfaces along root channels and few faint clay films on faces of peds; very strongly acid (pH 5.0); gradual wavy boundary.

Bct1—48 to 52 inches (121 to 131 centimeters); yellowish brown (10YR 5/8) sandy loam, brownish yellow (10YR 6/6) dry; massive; soft, very friable, slightly sticky and slightly plastic; few very fine, fine, medium, and coarse roots; few very fine and fine tubular pores; many faint clay films between sand grains; very strongly acid (pH 4.5); abrupt wavy boundary.

Bct2—52 to 56 inches (131 to 141 centimeters); yellowish brown (10YR 5/8) very gravelly loamy sand, brownish yellow (10YR 6/6) dry; massive; soft, very friable, slightly sticky and slightly plastic; few very fine and fine roots; few very fine tubular

pores; 43 percent rounded pebbles; few distinct clay films on rock fragments; very strongly acid (pH 5.0); clear wavy boundary.
C—52 to 79 inches (141 to 200 centimeters); light brownish gray (2.5Y 6/2) sandy loam, pale yellow (2.5Y 7/4) dry; massive; slightly hard, very friable, nonsticky and slightly plastic; common very fine and few fine and medium roots; common very fine and fine tubular pores; very strongly acid (pH 4.5).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 27 to 32 percent clay and 0 to 13 percent gravel

Water table: None noted

Reaction: Moderately acid to very strongly acid

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 7.5YR or 10YR

Value: 3 to 5 dry, 2 or 3 moist

Chroma: 2 or 3 dry or moist

Texture of the fine-earth fraction: Loam

Content of clay: 18 to 25 percent

Rock fragments: 0 to 13 percent

Bt horizon

Hue: 7.5YR, 10YR, or 2.5Y

Value: 4 to 7 dry, 3 to 6 moist

Chroma: 4 to 8 dry or moist

Texture of the fine-earth fraction: Loam, silt loam, clay loam, or silty clay loam

Content of clay: 18 to 32 percent

Rock fragments: 0 to 13 percent gravel

C horizon

Hue: 7.5YR, 10YR, or 2.5Y

Value: 5 to 7 dry, 4 to 6 moist

Chroma: 2 to 8 dry or moist

Texture of the fine-earth fraction: Loamy sand, fine sandy loam, or sandy loam

Content of clay: 0 to 10 percent

Rock fragments: 0 to 45 percent gravel

Panthercreek Series

Setting

Landscape position: Stabilized debris slides on mountain slopes

Parent material: Debris flow colluvium derived from schist

Slope: 30 to 75 percent

Elevation: 45 to 2,480 feet (15 to 757 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderate

Mean annual precipitation: 70 to 100 inches (1,780 to 2,550 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 240 to 300 days

Taxonomic classification: Loamy-skeletal, mixed, semiactive, isomesic Typic
Eutrudepts

Modal Pedon

Panthercreek gravelly loam, in an area of Panthercreek-Devils creek-Coppercreek complex, 50 to 75 percent slopes, on an uneven, northeast-facing slope of 72 percent, under redwood, western hemlock, tanoak, Douglas-fir, swordfern, deer fern, and redwood-sorrel, at an elevation of 960 feet (293 meters); in Redwood National Park, Humboldt County, California; USGS Bald Hills quadrangle; UTM zone 10, 417485mE, 4554819mN, NAD83.

Oi—0 to 2 inches (0 to 6 centimeters); fresh and slightly decomposed redwood needles and tanoak leaves and twigs.

A—2 to 7 inches (6 to 17 centimeters); very dark grayish brown (10YR 3/2) gravelly loam, grayish brown (10YR 5/2) dry; weak fine and medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and fine and few medium roots; many very fine and fine interstitial pores; 34 percent gravel; moderately acid (pH 5.8); clear wavy boundary.

Bw—7 to 16 inches (17 to 41 centimeters); brown (10YR 4/3) gravelly loam, pale brown (10YR 6/3) dry; moderate medium and coarse subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and few fine, medium, and coarse roots; many very fine and fine interstitial and few very fine tubular pores; 17 percent gravel and 7 percent cobbles; moderately acid (pH 6.0); gradual wavy boundary.

C1—16 to 34 inches (41 to 86 centimeters); dark gray (5Y 4/1) extremely gravelly loam, gray (5Y 6/1) dry; massive; soft, very friable, nonsticky and slightly plastic; few very fine, fine, medium, and coarse roots; many very fine interstitial pores; 60 percent gravel; slightly acid (pH 6.2); diffuse wavy boundary.

C2—34 to 50 inches (86 to 126 centimeters); dark gray (5Y 4/1) very gravelly loam, gray (5Y 5/1) dry; massive; hard, very friable, nonsticky and slightly plastic; few very fine, fine, medium, and coarse roots; many very fine interstitial pores; 43 percent gravel; slightly acid (pH 6.1); diffuse wavy boundary.

C3—50 to 67 inches (126 to 171 centimeters); dark gray (5Y 4/1) very gravelly loam, gray (5Y 5/1) dry; massive; hard, friable, nonsticky and slightly plastic; few very fine, fine, medium, and coarse roots; many very fine interstitial pores; 40 percent gravel; slightly acid (pH 6.1); gradual smooth boundary.

C4—67 to 89 inches (171 to 226 centimeters); dark gray (N 4/0) very gravelly loam, gray (N 5/0) dry; massive; hard, friable, slightly sticky and slightly plastic; few very fine, fine, and medium roots; common very fine interstitial pores; 35 percent gravel; neutral (pH 6.6).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 10 to 20 percent clay, 35 to 60 percent gravel, and 0 to 10 percent cobbles

Water table: None noted within a depth of 40 inches (102 centimeters)

Reaction: Moderately acid to very strongly acid

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist
Kind of organic material: Slightly decomposed
Wood fragments: 0 to 35 percent
Reaction: Neutral to moderately acid

A horizon

Hue: 10YR or 2.5Y
Value: 5 or 6 dry, 3 or 4 moist
Chroma: 2 or 3 dry or moist
Texture of the fine-earth fraction: Loam
Content of clay: 15 to 25 percent
Rock fragments: 20 to 35 percent gravel and 0 to 3 percent cobbles

Bw horizon

Hue: 10YR or 2.5Y
Value: 6 to 8 dry, 4 or 5 moist
Chroma: 2 to 4 dry, 2 or 3 moist
Texture of the fine-earth fraction: Loam
Content of clay: 15 to 25 percent
Rock fragments: 15 to 60 percent gravel and 0 to 10 percent cobbles

C horizon

Hue: 5Y or neutral
Value: 4 to 7 dry, 4 to 6 moist
Chroma: Neutral to 2 dry, neutral to 3 moist
Texture of the fine-earth fraction: Sandy loam or loam
Rock fragments: 35 to 60 percent gravel and 0 to 10 percent cobbles
Content of clay: 8 to 20 percent
Redoximorphic features:
 Type—fine and medium iron-manganese masses in the matrix; iron stains lining
 root channels and/or pores
 Quantity—common or many
 Hue—7.5YR or 10YR
 Value—5 to 7 moist
 Chroma—4 to 8 moist

Pasturerock Series

Setting

Landscape position: Mountain slopes
Parent material: Colluvium derived from sandstone and mudstone
Slope: 15 to 50 percent
Elevation: 170 to 3,160 feet (53 to 964 meters)
Depth class: Very deep
Drainage class: Well drained
Slowest saturated hydraulic conductivity: Moderately low
Slowest permeability: Slow
Mean annual precipitation: 70 to 100 inches (1,780 to 2,550 millimeters)
Mean annual temperature: 50 to 59 degrees F (10 to 15 degrees C)
Frost-free season: 200 to 270 days
Taxonomic classification: Fine-loamy, mixed, active, mesic Ultic Haploxeralfs

Modal Pedon

Pasturerock loam, in an area of Pasturerock-Coyoterock-Maneze complex, 30 to 50 percent slopes, on a convex, west-facing slope of 45 percent, under Oregon white

Soil Survey of Redwood National and State Parks, California

oak, annual grasses, perennial grasses, and forbs, at an elevation of 2,250 feet (686 meters); in Redwood National Park, Humboldt County, California; USGS Ball Hills quadrangle; UTM zone 10, 422118mE, 4559536mN, NAD83.

Oi—0 to 1 inch (0 to 2 centimeters); slightly decomposed oak leaves and herbaceous litter.

A—1 to 5 inches (2 to 12 centimeters); grayish brown (10YR 5/2) loam, very dark grayish brown (10YR 3/2) moist; moderate fine and medium subangular blocky structure; friable, slightly sticky and slightly plastic; many very fine and common fine roots; many fine irregular and common fine and medium tubular pores; about 8 percent small pebbles; slightly acid (pH 6.3); abrupt irregular boundary.

AB—5 to 8 inches (12 to 20 centimeters); grayish brown (10YR 5/2) clay loam, very dark grayish brown (10YR 3/2) moist; moderate medium and coarse subangular blocky structure; firm, moderately sticky and moderately plastic; common very fine, fine, and medium roots; common fine irregular and common fine and medium tubular pores; about 5 percent small pebbles; moderately acid (pH 5.9); clear wavy boundary.

Bt1—8 to 17 inches (20 to 42 centimeters); grayish brown (10YR 5/2) clay loam, very dark grayish brown (10YR 3/2) moist; moderate coarse subangular block structure; firm, moderately sticky and moderately plastic; many fine and medium and common very fine and coarse roots; common fine and medium and few coarse tubular pores; few faint clay films on surfaces along pores and on all faces of peds; about 8 percent gravel; moderately acid (pH 5.7); gradual wavy boundary.

Bt2—17 to 35 inches (42 to 90 centimeters); light brownish gray (10YR 6/2) very cobbly clay loam, dark grayish brown (10YR 4/2) moist; weak coarse subangular blocky structure; firm, moderately sticky and moderately plastic; common fine, medium, and coarse roots; few fine and medium tubular pores; few faint clay films on all faces of peds and on surfaces along pores; 20 percent gravel and 15 percent cobbles; moderately acid (pH 5.7); clear wavy boundary.

Bc1—35 to 48 inches (90 to 122 centimeters); pale brown (10YR 6/3) gravelly clay loam, brown (10YR 5/3) moist; weak coarse subangular blocky structure; firm, moderately sticky and moderately plastic; few fine, medium, and coarse roots; few fine tubular pores; few faint clay films on all faces of peds and on surfaces; 25 percent gravel; moderately acid (pH 5.7); diffuse smooth boundary.

C—48 to 69 inches (122 to 174 centimeters); pale brown (10YR 6/3) extremely gravelly sandy clay loam, brown (10YR 5/3) moist; massive; firm, moderately sticky and very plastic; few fine, medium, and coarse roots; few fine tubular pores; 75 percent gravel; moderately acid (pH 5.6).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 27 to 35 percent clay, 5 to 35 percent gravel, and 0 to 10 percent cobbles

Water table: None noted

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Neutral to moderately acid

A horizon

Hue: 10YR or 2.5Y

Value: 5 or 6 dry, 3 or 4 moist

Chroma: 2 or 3 dry or moist
Texture of the fine-earth fraction: Loam
Content of clay: 22 to 27 percent
Rock fragments: 3 to 10 percent gravel and 0 to 5 percent cobbles
Reaction: Slightly acid to strongly acid

Bt horizon

Hue: 10YR or 2.5Y
Value: 5 to 7 dry, 3 to 5 moist
Chroma: 2 to 4 dry or moist
Texture of the fine-earth fraction: Clay loam or silty clay loam
Content of clay: 27 to 35 percent
Rock fragments: 5 to 35 percent gravel and 0 to 15 percent cobbles
Reaction: Moderately acid or strongly acid

C horizon

Hue: 10YR or 2.5Y
Value: 5 or 6 dry, 4 or 5 moist
Chroma: 2 to 4 dry, neutral to 4 moist
Texture of the fine-earth fraction: Sandy clay loam, clay loam, or silty clay loam
Content of clay: 30 to 38 percent
Rock fragments: 15 to 75 percent gravel and 0 to 10 percent cobbles
Reaction: Moderately acid to neutral

Pigpen Series

Setting

Landscape position: Earthflows on lower mountain slopes
Parent material: Earthflow colluvium derived from mudstone and sandstone
Slope: 15 to 50 percent
Elevation: 215 to 3,185 feet (67 to 971 meters)
Depth class: Very deep
Drainage class: Somewhat poorly drained
Slowest saturated hydraulic conductivity: Low
Slowest permeability: Moderately slow
Mean annual precipitation: 70 to 90 inches (1,780 to 2,290 millimeters)
Mean annual temperature: 50 to 59 degrees F (10 to 15 degrees C)
Frost-free season: 250 to 280 days
Taxonomic classification: Loamy-skeletal, mixed, superactive, thermic Aquultic Haploxeralfs

Modal Pedon

Pigpen gravelly loam, in an area of Rainage-Pigpen complex, 15 to 50 percent slopes, on a hummocky, concave, southwest-facing slope of 32 percent, under annual grasses, and perennial grasses, forbs, and rushes with 25 percent gravel on the surface, at an elevation of 640 feet (195 meters); in Redwood National Park, Humboldt County, California; USGS Panther Creek quadrangle; UTM zone 10, 422889mE, 4552825mN, NAD83.

A—0 to 6 inches (0 to 15 centimeters); grayish brown (10YR 5/2) gravelly loam, very dark grayish brown (10YR 3/2) moist; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and common fine roots; many very fine irregular and many very fine and common fine tubular pores; 30 percent gravel; moderately acid (pH 6.0); clear wavy boundary.

AB—6 to 14 inches (15 to 36 centimeters); grayish brown (10YR 5/2) gravelly silty clay loam, very dark grayish brown (10YR 3/2) moist; moderate medium and coarse subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and few fine roots; common very fine and few fine tubular pores; 20 percent gravel and 5 percent cobbles; moderately acid (pH 6.0); clear wavy boundary.

Bt—14 to 32 inches (36 to 81 centimeters); variegated light yellowish brown (2.5Y 6/4) and gray (5Y 5/1) very cobbly silty clay loam, olive brown (2.5Y 4/4) and dark olive gray (5Y 3/2) moist; weak coarse and very coarse subangular blocky structure; hard, firm, slightly sticky and slightly plastic; few very fine and fine roots; few very fine tubular pores; common faint clay films on faces of ped; common medium prominent yellowish brown (10YR 5/6) masses of iron accumulation, strong brown (7.5YR 5/8) moist; 20 percent gravel and 15 percent cobbles; strongly acid (pH 5.5); abrupt wavy boundary.

Cg—32 to 59 inches (81 to 150 centimeters); gray (N 5/0) very gravelly clay loam, very dark gray (N 3/0) moist; massive; hard, friable, slightly sticky and slightly plastic; few very fine roots; few very fine tubular pores; few medium distinct light yellowish brown (2.5Y 6/4) masses of iron accumulation, light olive brown (2.5Y 5/4) moist; 40 percent gravel and 10 percent cobbles; slightly alkaline (pH 7.5).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 27 to 35 percent clay, 25 to 40 percent gravel, and 10 to 20 percent cobbles

Water table: At a depth of 12 to 20 inches (30 to 50 centimeters)

Surface fragments: 15 to 30 percent gravel

A horizon

Hue: 10YR or 2.5Y

Value: 4 to 6 dry, 2 to 4 moist

Chroma: 2 or 3 dry, 1 to 3 moist

Texture of the fine-earth fraction: Loam

Content of clay: 20 to 26 percent

Rock fragments: 20 to 30 percent gravel and 0 to 5 percent cobbles

Reaction: Moderately acid or strongly acid

Bt horizon

Hue: 10YR, 2.5Y, or 5Y

Value: 4 to 7 dry, 3 to 6 moist

Chroma: Neutral to 4 dry or moist

Texture of the fine-earth fraction: Clay loam or silty clay loam

Content of clay: 27 to 35 percent

Rock fragments: 20 to 40 percent gravel and 10 to 20 percent cobbles

Reaction: Moderately acid or strongly acid

Redoximorphic features:

Type—fine and medium iron-manganese masses in the matrix; iron stains lining root channels and/or pores

Quantity—common or many

Hue—7.5YR, 10YR, or 2.5Y

Value—5 or 6 dry, 4 to 6 moist

Chroma—4 to 6 dry, 4 to 8 moist

Cg horizon

Hue: 5Y or neutral

Value: 5 or 6 dry, 3 to 5 moist

Chroma: Neutral to 2 dry or moist

Texture of the fine-earth fraction: Clay loam or silty clay loam

Content of clay: 30 to 35 percent

Rock fragments: 30 to 60 percent gravel and 0 to 35 percent cobbles

Reaction: Slightly acid to slightly alkaline

Redoximorphic features:

Type—fine and medium iron-manganese masses in the matrix; iron stains lining root channels and/or pores

Quantity—common or many

Hue—7.5YR, 10YR, or 2.5Y

Value—5 or 6 dry, 4 to 6 moist

Chroma—4 to 6 dry, 4 to 8 moist

Pittplace Series

Setting

Landscape position: Broad ridges and upper mountain slopes

Parent material: Colluvium and residuum derived from sandstone, mudstone, and schist

Slope: 9 to 30 percent

Elevation: 990 to 2,780 feet (303 to 848 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately low

Slowest permeability: Slow

Mean annual precipitation: 80 to 100 inches (2,030 to 2,550 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 240 to 290 days

Taxonomic classification: Fine, mixed, semiactive, isomesic Ustic Palehumults

Modal Pedon

Pittplace clay loam, in an area of Wiregrass-Pittplace-Scaath complex, 9 to 30 percent slopes, on a slightly convex, northeast-facing slope of 20 percent, under tanoak, Douglas-fir, Pacific madrone, Pacific rhododendron, California huckleberry, Cascade barberry, and brackenfern, at an elevation of 1,900 feet (623 meters); in Redwood National and State Parks, Del Norte County, California; USGS Childs Hill quadrangle; UTM zone 10, 414131mE, 4613787mN, NAD83.

A—0 to 7 inches (0 to 17 centimeters); dark brown (7.5YR 3/4) clay loam, brown (7.5YR 5/4) dry; weak and moderate fine subangular blocky structure; slightly hard, friable, slightly sticky and moderately plastic; common very fine, fine, and medium roots; common very fine and fine irregular and common very fine, fine, medium, and coarse tubular pores; 10 percent gravel; very strongly acid (pH 4.7); clear smooth boundary.

Bt1—7 to 14 inches (17 to 36 centimeters); strong brown (7.5YR 4/6) gravelly clay loam, brown (7.5YR 5/6) dry; moderate fine and medium subangular blocky structure; hard, very firm, moderately sticky and moderately plastic; common very fine, fine, and medium roots; common very fine and fine irregular and common very fine, fine, medium, and coarse tubular pores; few distinct clay films on faces of peds; 20 percent gravel and 10 percent paragravel; very strongly acid (pH 4.5); clear wavy boundary.

Bt2—14 to 24 inches (36 to 60 centimeters); strong brown (7.5YR 4/6) gravelly silty clay loam, strong brown (7.5YR 5/6) dry; moderate fine subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; common very fine, fine, medium, and coarse roots; common very fine and fine irregular

and common very fine, fine, medium, and coarse tubular pores; few distinct clay films on faces of peds and on rock fragments; 15 percent gravel and 10 percent paragravel; very strongly acid (pH 4.5); clear smooth boundary.

Bt3—24 to 31 inches (60 to 78 centimeters); strong brown (7.5YR 5/6) paragravelly silty clay loam, reddish yellow (7.5YR 7/6) dry; moderate medium subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; common fine and medium roots; moderately few very fine and fine irregular and common fine and medium tubular pores; many distinct clay films on faces of peds and on rock fragments; 5 percent gravel and 20 percent paragravel; very strongly acid (pH 4.5); clear wavy boundary.

Bt4—31 to 43 inches (78 to 109 centimeters); yellowish red (5YR 5/6) paragravelly silty clay loam, reddish yellow (7.5YR 7/6) dry; moderate fine subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; common fine and medium roots; common very fine and fine irregular and common fine and medium tubular pores; many distinct clay films on faces of peds and on rock fragments; 5 percent gravel and 25 percent paragravel; very strongly acid (pH 4.5); gradual smooth boundary.

Bt5—43 to 56 inches (109 to 143 centimeters); yellowish red (5YR 5/6) gravelly clay loam, reddish yellow (7.5YR 7/6) dry; moderate fine and medium subangular blocky structure; hard, very firm, moderately sticky and very plastic; common fine and medium roots; common very fine and fine irregular and common fine and medium tubular pores; many distinct clay films on faces of peds and on rock fragments; 20 percent gravel and 20 percent paragravel; very strongly acid (pH 4.5); clear wavy boundary.

Bt6—56 to 63 inches (143 to 160 centimeters); yellowish red (5YR 5/6) very gravelly clay loam, reddish yellow (7.5YR 7/6) dry; weak medium and coarse subangular blocky structure; hard, very firm, moderately sticky and very plastic; very few fine roots; moderately few very fine irregular and common very fine and fine tubular pores; many distinct clay films on faces of peds and on rock fragments; 35 percent gravel, 1 percent cobbles, and 20 percent paragravel; very strongly acid (pH 4.5).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 35 to 50 percent clay, 0 to 25 percent gravel, and 0 to 20 percent paragravel

Water table: None noted

Reaction: Strongly acid or very strongly acid

O horizon (where present)

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 7.5YR or 10YR

Value: 5 to 7 dry, 3 to 5 moist

Chroma: 3 to 6 dry or moist

Texture of the fine-earth fraction: Clay loam

Content of clay: 27 to 35 percent

Rock fragments: 0 to 13 percent gravel

Upper part of the Bt horizon

Hue: 7.5YR, 10YR, or 2.5Y

Value: 5 to 7 dry, 4 or 5 moist
Chroma: 4 to 6 dry, 4 to 8 moist
Texture of the fine-earth fraction: Clay loam, silty clay loam, silty clay, or clay
Content of clay: 35 to 50 percent
Rock fragments: 0 to 25 percent gravel
Pararock fragments: 0 to 20 percent paragravel

Lower part of the Bt horizon

Hue: 5YR, 7.5YR, 10YR, or 2.5Y
Value: 5 to 7 dry, 4 or 5 moist
Chroma: 4 to 6 dry, 4 to 8 moist
Texture of the fine-earth fraction: Clay loam, silty clay loam, silty clay, or clay
Content of clay: 35 to 50 percent
Rock fragments: 5 to 40 percent gravel and 0 to 3 percent cobbles
Pararock fragments: 0 to 25 percent paragravel

Raingage Series

Setting

Landscape position: Earthflows on lower mountain slopes
Parent material: Earthflow colluvium derived from mudstone and sandstone (fig. 22)
Slope: 15 to 50 percent
Elevation: 215 to 3,185 feet (67 to 971 meters)
Depth class: Very deep
Drainage class: Moderately well drained
Slowest saturated hydraulic conductivity: Low
Slowest permeability: Moderately slow
Mean annual precipitation: 70 to 90 inches (1,780 to 2,290 millimeters)
Mean annual temperature: 50 to 59 degrees F (10 to 15 degrees C)
Frost-free season: 250 to 280 days
Taxonomic classification: Fine-loamy, mixed, superactive, thermic Aquultic Haploxeralfs

Modal Pedon

Raingage loam, in an area of Raingage-Pigpen complex, 15 to 50 percent slopes, on a convex, southwest-facing slope of 18 percent, under hairy cat's ear, orchardgrass, and bristly dogstail grass, at an elevation of 970 feet (295 meters); in Redwood National Park, Humboldt County, California; USGS Panther Creek quadrangle; UTM zone 10, 422455mE, 4553550mN, NAD83.

- A—0 to 17 inches (0 to 44 centimeters); grayish brown (10YR 5/2) loam, very dark grayish brown (10YR 3/2) moist; weak fine and medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine and common fine roots; many very fine and common fine tubular pores; 9 percent gravel; strongly acid (pH 5.5); abrupt wavy boundary.
- BA—17 to 26 inches (44 to 65 centimeters); pale brown (10YR 6/3) very gravelly loam, olive brown (2.5Y 4/3) moist; weak coarse subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and few fine roots; common very fine tubular pores; 36 percent gravel; strongly acid (pH 5.5); clear wavy boundary.
- Btg—26 to 51 inches (65 to 130 centimeters); light olive gray (5Y 6/2) gravelly silty clay loam, olive gray (5Y 5/2) moist; weak coarse subangular blocky structure; hard, firm, slightly sticky and slightly plastic; few very fine roots; few very fine tubular pores; few faint clay films and many prominent silt flows in pores; common medium prominent brownish yellow (10YR 6/6) masses of iron accumulation,

Figure 22.—A profile of a Rainage soil. These soils are on lower, unstable mountain slopes under prairie vegetation. Depth is marked in centimeters.

strong brown (7.5YR 5/6) moist; 20 percent gravel; strongly acid (pH 5.5); clear wavy boundary.

Cg1—51 to 55 inches (130 to 140 centimeters); gray (N 5/0) gravelly silty clay loam, dark gray (N 4/0) moist; massive; hard, firm, moderately sticky and slightly plastic; few very fine tubular pores; common medium prominent brownish yellow (10YR 6/6) masses of iron accumulation, yellowish brown (10YR 5/6) moist; 16 percent gravel; slightly acid (pH 6.5); clear wavy boundary.

Cg2—55 to 59 inches (140 to 150 centimeters); gray (N 5/0) gravelly silty clay loam, dark gray (N 4/0) moist; massive; hard, firm, moderately sticky and slightly plastic; few very fine tubular pores; 29 percent gravel, rock content increasing irregularly with depth; neutral (pH 7.0).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 30 to 35 percent clay, 10 to 23 percent gravel, and 0 to 20 percent cobbles

Water table: At a depth of 20 to 30 inches (50 to 75 centimeters)

Surface fragments: 3 to 10 percent gravel

A horizon

Hue: 10YR or 2.5Y

Value: 4 to 6 dry, 2 to 4 moist

Chroma: 2 to 4 dry, 1 to 3 moist

Texture of the fine-earth fraction: Loam

Content of clay: 20 to 26 percent

Rock fragments: 5 to 13 percent gravel

Reaction: Moderately acid or strongly acid

Btg horizon

Hue: 10YR, 2.5Y, or 5Y

Value: 5 to 7 dry, 3 to 6 moist

Chroma: Neutral to 3 dry, 1 to 4 moist

Texture of the fine-earth fraction: Clay loam or silty clay loam

Content of clay: 30 to 35 percent

Rock fragments: 10 to 23 percent gravel and 0 to 20 percent cobbles

Reaction: Moderately acid or strongly acid

Redoximorphic features:

Type—fine and medium iron-manganese masses in the matrix; iron stains lining root channels and/or pores

Quantity—common or many

Hue—7.5YR, 10YR, or 2.5Y

Value—5 to 7 dry, 4 to 6 moist

Chroma—4 to 6 dry, 4 to 8 moist

Cg horizon

Hue: 2.5Y, 5Y, or neutral

Value: 5 or 6 dry, 4 to 6 moist

Chroma: Neutral to 2 dry or moist

Texture of the fine-earth fraction: Clay loam or silty clay loam

Content of clay: 33 to 35 percent

Rock fragments: 10 to 35 percent gravel and 0 to 20 percent cobbles

Reaction: Slightly acid to slightly alkaline

Redoximorphic features:

Type—fine and medium iron-manganese masses in the matrix; iron stains lining root channels and/or pores

Quantity—common or many

Hue—7.5YR, 10YR, or 2.5Y
Value—5 to 7 dry, 4 or 5 moist
Chroma—4 to 6 dry, 4 to 8 moist

Rockysaddle Series

Setting

Landscape position: Mountain slopes

Parent material: Colluvium and residuum derived from sandstone, mudstone, and schist

Slope: 30 to 75 percent

Elevation: 275 to 3,185 feet (85 to 972 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately low to moderately high

Slowest permeability: Slow or moderately slow

Mean annual precipitation: 75 to 100 inches (1,900 to 2,550 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 240 to 290 days

Taxonomic classification: Loamy-skeletal, mixed, semiactive, isomesic Ustic Palehumults

Modal Pedon

Rockysaddle extremely gravelly loam, in an area of Wiregrass-Rockysaddle-Scaath complex, 30 to 50 percent slopes, on a uniform, west-facing slope of 36 percent, under tanoak, madrone, and Douglas-fir, at an elevation of 2,400 feet (732 meters); in Redwood National Park, Humboldt County, California; USGS Bald Hills quadrangle; UTM zone 10, 424029mE, 4555178mN, NAD83.

Oi—0 to 2 inches (0 to 6 centimeters); fresh and slightly decomposed tanoak and madrone leaves, twigs, and bark; fungal mycelia at interface with mineral soil.

A—2 to 6 inches (6 to 14 centimeters); dark brown (7.5YR 3/3) extremely gravelly loam, brown (10YR 5/3) dry; moderate fine and medium granular structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine and fine irregular and common medium and coarse tubular pores; 85 percent gravel; moderately acid (pH 5.7); abrupt smooth boundary.

AB—6 to 14 inches (14 to 35 centimeters); dark yellowish brown (7.5YR 3/4) very gravelly loam, light yellowish brown (10YR 6/4) dry; weak fine and medium subangular blocky and moderate fine and medium granular structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine, medium, and coarse roots; common very fine and fine irregular and common medium and coarse tubular pores; 58 percent gravel; moderately acid (pH 5.6); gradual wavy boundary.

BAt1—14 to 21 inches (35 to 54 centimeters); dark yellowish brown (10YR 4/4) extremely gravelly clay loam, light yellowish brown (10YR 6/4) dry; moderate fine granular and moderate medium and coarse subangular blocky structure; hard, friable, slightly sticky and slightly plastic; common very fine, fine, medium, and coarse roots; common very fine and fine interstitial and common medium and coarse tubular pores; 67 percent gravel; strongly acid (pH 5.3); clear smooth boundary.

BAt2—21 to 27 inches (54 to 69 centimeters); yellowish brown (10YR 5/4) very gravelly clay loam, very pale brown (10YR 7/4) dry; moderate medium and coarse subangular blocky structure; hard, friable, slightly sticky and slightly plastic; common very fine, fine, medium, and coarse roots; common very fine and fine

interstitial and common medium and few coarse tubular pores; 52 percent gravel; strongly acid (pH 5.4); clear smooth boundary.

Bt1—27 to 37 inches (69 to 95 centimeters); yellowish brown (10YR 5/6) very gravelly silty clay loam, very pale brown (10YR 7/4) dry; moderate medium subangular blocky structure; hard, friable, slightly sticky and slightly plastic; common very fine, fine, and medium and few coarse roots; common very fine and fine interstitial and common medium and coarse tubular pores; few faint clay films lining pores and coating gravel; 50 percent gravel; strongly acid (pH 5.3); clear smooth boundary.

Bt2—37 to 45 inches (95 to 113 centimeters); yellowish brown (10YR 5/4) very gravelly silty clay loam, very pale brown (10YR 7/3) dry; moderate coarse subangular blocky structure; hard, friable, slightly sticky and slightly plastic; common very fine, fine, medium, and coarse roots; common very fine and fine interstitial and common medium and few coarse tubular pores; few distinct clay films lining pores and on faces of pedis; 36 percent gravel; strongly acid (pH 5.4); gradual smooth boundary.

Bc1—45 to 61 inches (113 to 156 centimeters); yellowish brown (10YR 5/4) extremely gravelly silty clay loam, very pale brown (10YR 7/3) dry; massive; hard, friable, moderately sticky and slightly plastic; common very fine, fine, and medium and few coarse roots; common very fine and fine interstitial and common medium and few coarse tubular pores; few faint clay films lining pores; 73 percent gravel; strongly acid (pH 5.4).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 25 to 35 percent clay, 35 to 80 percent gravel, 0 to 40 percent cobbles, and 0 to 10 percent stones

Water table: None noted

Reaction: Moderately acid to very strongly acid

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 7.5YR or 10YR

Value: 5 or 6 dry, 3 or 4 moist

Chroma: 2 to 4 dry or moist

Texture of the fine-earth fraction: Loam

Content of clay: 20 to 27 percent

Rock fragments: 15 to 85 percent gravel and 0 to 5 percent cobbles

Bt horizon

Hue: 10YR or 2.5Y

Value: 6 to 8 dry, 4 or 5 moist

Chroma: 2 to 4 dry, 3 to 6 moist

Texture of the fine-earth fraction: Loam, clay loam, or silty clay loam

Content of clay: 25 to 40 percent

Rock fragments: 35 to 80 percent gravel, 0 to 40 percent cobbles, and 0 to 10 percent stones

C horizon

Hue: 10YR or 2.5Y

Value: 6 to 8 dry, 4 or 5 moist

Chroma: 2 to 4 dry, 3 to 6 moist

Texture of the fine-earth fraction: Loam, clay loam, or silty clay loam

Content of clay: 25 to 40 percent

Rock fragments: 20 to 85 percent gravel, 0 to 50 percent cobbles, and 0 to 15 percent stones

Rodgerpeak Series

Setting

Landscape position: Gently convex to planar areas on ridges

Parent material: Residuum derived from quartz-mica schist

Slope: 0 to 15 percent

Elevation: 2,675 to 2,780 feet (816 to 848 meters)

Depth class: Shallow

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderate

Mean annual precipitation: 90 to 100 inches (2,290 to 2,550 millimeters)

Mean annual temperature: 46 to 55 degrees F (8 to 13 degrees C)

Frost-free season: 220 to 250 days

Taxonomic classification: Loamy, mixed, active, isomesic Lithic Dystrustepts

Modal Pedon

Rodgerpeak gravelly loam, in an area of Rodgerpeak-Wiregrass complex, 0 to 15 percent slopes, on a uniform, east-facing slope of 1 percent, under second growth Douglas-fir, redwood, tanoak, Pacific madrone, salal, and hairy manzanita, at an elevation of 2,740 feet (835 meters); in Redwood National Park, Humboldt County, California; USGS Rodger's Peak quadrangle; UTM zone 10, 414171mE, 4556801mN, NAD83.

Oi—0 to 0.5 inch (0 to 1 centimeter); fresh and slightly decomposed redwood needles, salal leaves, salal twigs, and humus; angular pebbles (50 percent gravel pavement).

A—0.5 to 7 inches (1 to 19 centimeters); dark brown (7.5YR 3/4) gravelly loam, brown (7.5YR 5/4) dry; weak fine and medium subangular blocky structure; slightly hard, friable, moderately sticky and slightly plastic; many very fine, fine, and medium and common coarse roots; few very fine irregular and common very fine and fine tubular pores; 29 percent gravel; strongly acid (pH 5.5); gradual wavy boundary.

BA—7 to 12 inches (19 to 30 centimeters); strong brown (7.5YR 4/6) loam, strong brown (7.5YR 5/6) dry; weak medium and coarse subangular blocky structure; hard, friable, slightly sticky and slightly plastic; many very fine, fine, and medium and common coarse roots; common very fine and fine and few medium tubular pores; 13 percent gravel; strongly acid (pH 5.5); gradual wavy boundary.

Bw—12 to 18 inches (30 to 45 centimeters); dark yellowish brown (10YR 4/6) gravelly loam, brownish yellow (10YR 6/6) dry; weak medium and coarse subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and common fine, medium, and coarse roots; few very fine and fine tubular pores; 15- by 30-centimeter krotovina filled with reddish yellow (5YR 6/6) clay loam, yellowish red (5YR 5/6) moist; 30 percent gravel; moderately acid (pH 6.0); clear wavy boundary.

R—18 inches (45 centimeters); hard quartz-mica schist; pieces can only be chipped out with hand tools; depth to rock in the pit ranges from 14 to 20 inches.

Range in Characteristics

Depth to hard bedrock: 10 to 20 inches (25 to 50 centimeters)

Control section (by weighted average): 15 to 30 percent clay, 15 to 30 percent gravel, and 0 to 5 percent cobbles

Water table: None noted

Reaction: Moderately acid or strongly acid

Surface fragments: 10 to 70 percent gravel

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 7.5YR or 10YR

Value: 5 dry, 3 to 5 moist

Chroma: 3 to 5 dry, 3 or 4 moist

Texture of the fine-earth fraction: Loam

Content of clay: 15 to 27 percent

Rock fragments: 15 to 30 percent gravel and 0 to 5 percent cobbles

Bw horizon

Hue: 7.5YR or 10YR

Value: 5 to 7 dry, 4 or 5 moist

Chroma: 4 to 6 dry, 4 to 8 moist

Texture of the fine-earth fraction: Loam, clay loam, or silty clay loam

Content of clay: 20 to 30 percent

Rock fragments: 15 to 30 percent gravel and 0 to 5 percent cobbles

Russ Series

Setting

Landscape position: Lower alluvial flats and on flood plains

Parent material: Alluvium derived from mixed sources

Slope: 2 to 5 percent

Elevation: 35 to 145 feet (11 to 45 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderate

Flooding: Occasional

Mean annual precipitation: 60 to 75 inches (1,520 to 1,900 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 300 to 330 days

Taxonomic classification: Coarse-loamy, mixed, superactive, nonacid, mesic Typic Udifluvents

Modal Pedon

Russ loam, in an area of Russ, 0 to 2 percent slopes, on a slope of 1 percent, under pasture, at an elevation of 20 feet (6 meters); Humboldt County, California; USGS Fortuna quadrangle; UTM zone 10, 397831mE, 446332mN, NAD83.

- Ap—0 to 12 inches (0 to 30 centimeters); very dark grayish brown (2.5Y 3/2) loam, light brownish gray (2.5Y 6/2) dry; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine roots throughout; many very fine and fine irregular pores; few fine faint dark yellowish brown (10YR 3/6) iron-manganese masses in the matrix; slightly acid (pH 6.4); diffuse wavy boundary.
- C1—12 to 14 inches (30 to 36 centimeters); very dark grayish brown (2.5Y 3/2) fine sandy loam, light brownish gray (2.5Y 6/2) dry; massive; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots throughout; many very fine and fine irregular pores; slightly acid (pH 6.4); diffuse wavy boundary.
- C2—14 to 20 inches (36 to 52 centimeters); dark grayish brown (2.5Y 4/2) fine sandy loam, light brownish gray (2.5Y 6/2) dry; massive; slightly hard, friable, slightly sticky and nonplastic; common very fine and fine roots throughout; many very fine to coarse dendritic tubular pores; neutral (pH 6.6); abrupt wavy boundary.
- C3—20 to 50 inches (52 to 127 centimeters); dark grayish brown (2.5Y 4/2) fine sandy loam, light brownish gray (2.5Y 6/2) dry; massive; slightly hard, friable, slightly sticky and nonplastic; few very fine and fine roots throughout; common very fine and fine dendritic tubular pores; neutral (pH 6.6); abrupt wavy boundary.
- C4—50 to 60 inches (127 to 153 centimeters); dark grayish brown (2.5Y 4/2) stratified loamy fine sand to fine sandy loam, light brownish gray (2.5Y 6/2) dry; massive, single grain; soft, very friable, nonsticky and nonplastic; few very fine roots throughout; common very fine and fine dendritic tubular pores; common fine distinct dark yellowish brown (10YR 3/6) iron-manganese masses in the matrix; common medium distinct dark gray (2.5Y 4/1) iron depletions in the matrix; neutral (pH 6.8).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 10 to 18 percent clay

Water table: At a depth of 40 to 60 inches (100 to 150 centimeters) in January and February and greater than 72 inches (183 centimeters) March through December

Surface fragments: 0 to 5 percent gravel

A or Ap horizon

Hue: 10YR or 2.5Y

Value: 3 to 6 dry or moist

Chroma: 1 to 3 dry, 1 or 2 moist

Texture of the fine-earth fraction: Loam

Content of clay: 10 to 24 percent

Rock fragments: 0 to 3 percent gravel

Reaction: Neutral or slightly acid

Upper part of the C horizon

Hue: 10YR or 2.5Y

Value: 5 or 6 dry, 3 or 4 moist

Chroma: Neutral to 3 dry, neutral to 2 moist

Texture of the fine-earth fraction: Loamy coarse sand, fine sandy loam, or loam

Content of clay: 10 to 20 percent

Reaction: Neutral or slightly acid

Lower part of the C horizon

Hue: 10YR or 2.5Y

Value: 5 or 6 dry, 3 or 4 moist

Chroma: Neutral to 3 dry, neutral to 2 moist

Texture of the fine-earth fraction: Loamy coarse sand, loamy fine sand, fine sandy loam, loam, or silt loam

Content of clay: 5 to 20 percent

Reaction: Neutral to moderately acid

Redoximorphic features:

Type—fine and medium iron-manganese masses in the matrix; iron stains lining root channels and/or pores

Quantity—few or common

Hue—7.5YR or 10YR

Value—3 or 4 moist

Chroma—4 to 6 moist

Samoa Series

Setting

Landscape position: Recently stabilized dunes

Parent material: Eolian and marine sand derived from mixed sources

Slope: 2 to 50 percent

Elevation: 0 to 65 feet (0 to 20 meters)

Depth class: Very deep

Drainage class: Somewhat excessively drained

Slowest saturated hydraulic conductivity: Very high

Slowest permeability: Rapid

Mean annual precipitation: 35 to 80 inches (890 to 2,030 millimeters)

Mean annual temperature: 54 to 59 degrees F (12 to 15 degrees C)

Frost-free season: 275 to 330 days

Taxonomic classification: Mixed, mesic Typic Udipsamments

Modal Pedon

Samoa sand, in an area of Samoa-Clambeach-Dune land complex, 0 to 50 percent slopes, on a northeast-facing 50 percent slope under California polypody, coyotebrush, yellow bush lupine, Brewer's rush, and riggut brome, at an elevation of 20 feet (6 meters); about 3 miles west of the town of Arcata; Humboldt County, California; USGS Eureka quadrangle; UTM zone 10, 402112mE, 4524410mN, NAD83.

Oi—0 to 1 inch (0 to 1 centimeter); slightly decomposed moss, grass, and forb litter, very dark brown (10YR 2/2) rubbed; 95 percent fibers unrubbed, 5 percent rubbed; moderately acid (pH 5.6).

A1—1 to 2 inches (1 to 4 centimeters); very dark brown (10YR 2/2) sand, dark brown (10YR 3/3) dry; weak very fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine and fine and few medium roots throughout; many very fine irregular pores; moderately acid (pH 6.0); clear wavy boundary.

A2—2 to 6 inches (4 to 14 centimeters); very dark grayish brown (2.5Y 3/2) sand, grayish brown (2.5Y 5/2) dry; 30 percent weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; 70 percent single grain; loose, loose, nonsticky and nonplastic; many very fine, common fine and medium, and few coarse roots throughout; few very fine tubular pores; 5 percent fine distinct dark yellowish brown (10YR 4/4) iron-manganese masses along root channels; moderately acid (pH 6.0); gradual wavy boundary.

AC—6 to 18 inches (14 to 45 centimeters); very dark grayish brown (2.5Y 3/2) sand, grayish brown (2.5Y 5/2) dry; single grain; loose, nonsticky and nonplastic; common very fine, fine, and medium and few coarse roots throughout; many very fine and fine interstitial pores; 1 percent fine distinct dark yellowish brown (10YR 4/4) iron-manganese masses along root channels; moderately acid (pH 6.0); gradual wavy boundary.

C—18 to 63 inches (45 to 160 centimeters); dark olive gray (5Y 3/2) sand, olive gray (5Y 5/2) dry; single grain; loose, nonsticky and nonplastic; few very fine, fine, and medium roots throughout; many very fine and fine interstitial pores; slightly acid (pH 6.4).

Range in Characteristics

Control section (by weighted average): 0 to 1 percent clay and 0 to 30 percent rock fragments

Water table: None noted

Surface fragments: 0 to 5 percent gravel

Other: The A horizon is not present in areas where the dunes have sparse dune-mat vegetation or have been recently stabilized by European beachgrass.

O horizon (where present)

Hue: 10YR

Value: 2 to 4 dry or moist

Chroma: 2 dry or moist

Kind of organic material: Slightly decomposed

Reaction: Neutral

A horizon

Hue: 10YR, 2.5Y, or 5Y

Value: 3 to 6 dry, 2 or 3 moist

Chroma: 1 to 3 dry or moist

Texture of the fine-earth fraction: Fine sand and sand

Content of clay: 0 to 2 percent

Rock fragments: 0 to 5 percent gravel

Reaction: Moderately acid

Redoximorphic features (where present):

Type—fine iron-manganese masses along root channels

Quantity—few

Hue—10YR or 2.5Y

Value—4 or 5 moist

Chroma—3 or 4 moist

C horizon

Hue: 2.5Y or 5Y

Value: 5 dry, 3 or 4 moist

Chroma: 1 to 3 dry or moist

Texture of the fine-earth fraction: Fine sand and sand

Content of clay: 0 to 1 percent

Rock fragments: 0 to 30 percent gravel

Reaction: Slightly acid or neutral

Sasquatch Series

Setting

Landscape position: Mountain slopes, hillslopes, and broad ridges

Parent material: Colluvium and residuum derived from sandstone and mudstone (fig. 23)

Slope: 5 to 75 percent

Elevation: 15 to 1,850 feet (5 to 565 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately low to moderately high

Figure 23.—A profile of a Sasquatch soil. These soils form in colluvium and residuum derived from sandstone and mudstone. The thick, dark surface is the dominant feature of soils that form under a thick cover of swordfern. Depth is marked in centimeters.

Slowest permeability: Slow or moderately slow

Mean annual precipitation: 65 to 90 inches (1,650 to 2,290 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 250 to 325 days

Taxonomic classification: Fine-loamy, mixed, superactive, isomesic Typic Palehumults

Modal Pedon

Sasquatch loam, in an area of Sasquatch-Sisterrocks-Ladybird complex, 30 to 50 percent slopes, on a uniform, southwest-facing slope of 40 percent, under redwood, Douglas-fir, western hemlock, thimbleberry, salmonberry, California huckleberry, salal, Pacific rhododendron, redwood-sorrel, and swordfern, at an elevation of 290 meters (951 feet); in Del Norte Coastal Redwoods State Park, Del Norte County, California; USGS Childs Hill quadrangle; UTM zone 10, 406871mE, 4611952mN, NAD83.

Oi—0 to 1 inch (0 to 3 centimeters); very dark brown (10YR 2/2) slightly decomposed needles, leaves, and twigs, brown (10YR 5/3) dry; common very fine and fine roots; many very fine and fine and common interstitial pores; 20 percent wood fragments; strongly acid (pH 5.2); abrupt smooth boundary.

A1—1 to 4 inches (3 to 11 centimeters); very dark brown (10YR 2/2) loam, dark grayish brown (10YR 4/2) dry; moderate very fine and fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and medium and few fine roots; common very fine and fine tubular and interstitial pores; 8 percent gravel; strongly acid (pH 5.2); clear wavy boundary.

A2—4 to 17 inches (11 to 43 centimeters); very dark grayish brown (10YR 3/2) loam, brown (10YR 5/3) dry; weak very fine and moderate fine subangular blocky structure; slightly hard, friable, slightly sticky and moderately plastic; common very fine, fine, medium, and coarse roots; common very fine and fine tubular and common fine interstitial pores; strongly acid (pH 5.2); 5 percent gravel; clear wavy boundary.

BAt—17 to 26 inches (43 to 67 centimeters); dark brown (7.5YR 3/4) clay loam, yellowish brown (10YR 5/4) dry; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky and moderately plastic; common very fine, fine, and medium roots; common very fine and fine tubular and interstitial and few medium tubular pores; 8 percent gravel; strongly acid (pH 5.4); clear wavy boundary.

Bt1—26 to 46 inches (67 to 117 centimeters); strong brown (7.5YR 5/6) cobbly clay loam, yellow (10YR 7/6) dry; weak fine and medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; common very fine, fine, and medium and few coarse roots; common very fine and fine tubular and interstitial and few medium tubular pores; 15 percent gravel and 7 percent cobbles; very strongly acid (pH 5.0); clear wavy boundary.

Bt2—46 to 56 inches (117 to 141 centimeters); strong brown (7.5YR 5/6) clay loam, reddish yellow (7.5YR 7/6) dry; moderate fine and medium subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; moderately few very fine and common fine, medium, and coarse roots; moderately few very fine, common fine, and few medium tubular pores; common distinct clay films on faces of peds; 10 percent gravel; very strongly acid (pH 4.8); clear wavy boundary.

Bt3—56 to 70 inches (141 to 179 centimeters); light yellowish brown (2.5Y 6/4) gravelly clay loam, yellow (2.5Y 7/6) dry; moderate medium and weak coarse subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; moderately few very fine, fine, and medium roots; moderately few fine tubular pores; common distinct clay films on faces of peds; 20 percent gravel; very strongly acid (pH 5.0); clear wavy boundary.

B_{Ct}—70 to 79 inches (179 to 200 centimeters); light olive brown (2.5Y 5/6) gravelly clay loam, yellow (2.5Y 7/6) dry; weak medium and coarse subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; common fine and medium and few coarse and very coarse roots; moderately few fine tubular and interstitial pores; 15 percent gravel; very strongly acid (pH 4.8).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 27 to 35 percent clay, 0 to 35 percent gravel, 0 to 7 percent cobbles, and 0 to 20 percent paragravel

Water table: None noted

Reaction: Moderately acid to very strongly acid

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Content of clay: 0 to 5 percent

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 7.5YR or 10YR

Value: 4 or 5 dry, 2 or 3 moist

Chroma: 2 to 4 dry, 1 to 4 moist

Texture of the fine-earth fraction: Loam

Content of clay: 20 to 27 percent

Rock fragments: 0 to 35 percent gravel and 0 to 5 percent cobbles

Bt horizon

Hue: 7.5YR, 10YR, or 2.5Y

Value: 4 to 7 dry, 3 to 6 moist

Chroma: 4 to 6 dry, 3 to 6 moist

Texture of the fine-earth fraction: Clay loam or silty clay loam

Content of clay: 27 to 40 percent

Rock fragments: 0 to 35 percent gravel and 0 to 7 percent cobbles

Pararock fragments: 0 to 20 percent paragravel

Scaath Series

Setting

Landscape position: Strongly convex mountain slopes and narrow ridges

Parent material: Colluvium and residuum derived from sandstone, mudstone, and schist

Slope: 15 to 75 percent

Elevation: 445 to 3,185 feet (137 to 972 meters)

Depth class: Moderately deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderately slow or moderate

Mean annual precipitation: 75 to 100 inches (1,900 to 2,550 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 220 to 290 days

Taxonomic classification: Loamy-skeletal, mixed, active, isomesic Ustic Haplohumults

Modal Pedon

Scaath gravelly loam, in an area of Scaath-Rockysaddle-Wiregrass complex, dry, 50 to 75 percent slopes, on a uniform, south-facing slope of 56 percent, under tanoak, Douglas-fir, Pacific madrone, and sparse California huckleberry, at an elevation of 2,000 feet (610 meters); in Redwood National Park, Humboldt County, California; USGS Bald Hills quadrangle; UTM zone 10, 417636mE, 4564161mN, NAD83.

- Oi—0 to 1 inch (0 to 4 centimeters); slightly decomposed Douglas-fir needles, twigs, cones, and tanoak leaves.
- Oe—1 to 2 inches (4 to 5 centimeters); moderately decomposed leaves, humus, and fungal mycelia.
- A—2 to 11 inches (5 to 29 centimeters); dark brown (10YR 3/3) gravelly loam, brown (10YR 5/3) dry; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common fine and medium and few coarse roots; common very fine and fine irregular and common very fine and fine tubular pores; 15 percent fine and 5 percent coarse pebbles; strongly acid (pH 5.1); clear wavy boundary.
- ABt—11 to 18 inches (29 to 45 centimeters); dark yellowish brown (10YR 3/4) gravelly clay loam, yellowish brown (10YR 5/4) dry; weak medium subangular blocky structure; hard, friable, slightly sticky and slightly plastic; common fine, medium, and coarse roots; common very fine irregular and common very fine, fine, and medium tubular pores; 15 percent fine and 8 percent coarse pebbles; strongly acid (pH 5.4); abrupt wavy boundary.
- 2BAt—18 to 24 inches (45 to 61 centimeters); brown (7.5YR 4/4) very cobbly clay loam, light brown (7.5YR 6/4) dry; weak fine subangular blocky structure; hard, firm, moderately sticky and slightly plastic; few very fine and fine, common medium, and few coarse roots; few very fine irregular and few very fine and fine tubular pores; 25 percent fine pebbles, 10 percent coarse pebbles, and 20 percent cobbles; strongly acid (pH 5.4); clear wavy boundary.
- 2Bt1—24 to 33 inches (61 to 83 centimeters); yellowish brown (10YR 5/6) extremely cobbly clay loam, very pale brown (10YR 7/5) dry; weak fine subangular blocky structure; slightly hard, firm, moderately sticky and moderately plastic; few very fine, fine, and coarse and common medium roots; few very fine tubular pores; common faint clay films on faces of peds; 20 percent coarse pebbles, 15 percent fine pebbles, and 50 percent cobbles; strongly acid (pH 5.4); clear broken boundary.
- 2Bt2—33 to 37 inches (83 to 94 centimeters); dark yellowish brown (10YR 4/4) extremely gravelly clay loam, light yellowish brown (10YR 6/4) dry; weak coarse subangular blocky structure; slightly hard, firm, moderately sticky and moderately plastic; few fine and medium roots; few very fine tubular pores; common distinct clay films on faces of peds; 50 percent fine pebbles and 25 percent coarse pebbles; strongly acid (pH 5.5); abrupt irregular boundary.
- 2R—37 inches (94 centimeters); fractured shale; fractures mostly less than 1 millimeter across and greater than 10 centimeters apart; about 1 percent soil material in fractures and pockets; few medium and fine roots; few very fine interstitial pores; common prominent clay films on fracture faces; strongly acid (pH 5.5).

Range in Characteristics

Depth to hard bedrock: 20 to 40 inches (50 to 100 centimeters)

Control section (by weighted average): 25 to 35 percent clay, 35 to 75 percent gravel, and 0 to 50 percent cobbles

Water table: None noted

Reaction: Moderately acid to very strongly acid

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Soil Survey of Redwood National and State Parks, California

Chroma: 1 to 4 dry or moist
Kind of organic material: Slightly or moderately decomposed
Wood fragments: 0 to 35 percent
Reaction: Moderately acid to very strongly acid

A horizon

Hue: 7.5YR or 10YR
Value: 3 to 5 dry, 2 to 4 moist
Chroma: 3 or 4 dry, 2 to 4 moist
Texture of the fine-earth fraction: Loam
Content of clay: 23 to 27 percent
Rock fragments: 15 to 30 percent gravel and 0 to 5 percent cobbles

2Bt horizon (not all pedons have a lithologic discontinuity)

Hue: 7.5YR or 10YR
Value: 5 to 7 dry, 3 to 5 moist
Chroma: 4 to 6 dry or moist
Texture of the fine-earth fraction: Loam or clay loam
Content of clay: 25 to 35 percent
Rock fragments: 30 to 75 percent gravel and 0 to 50 percent cobbles

C horizon (where present)

Hue: 7.5YR, 10YR, or 2.5Y
Value: 5 to 7 dry, 4 to 6 moist
Chroma: 4 to 6 dry or moist
Texture of the fine-earth fraction: Loam
Content of clay: 20 to 30 percent
Rock fragments: 35 to 55 percent gravel and 0 to 15 percent cobbles

Sidehill Series

Setting

Landscape position: Mountain slopes
Parent material: Colluvium and residuum derived from sandstone
Slope: 30 to 100 percent
Elevation: 45 to 4,755 feet (15 to 1,450 meters)
Depth class: Moderately deep
Drainage class: Well drained
Slowest saturated hydraulic conductivity: Moderately high
Slowest permeability: Moderate
Mean annual precipitation: 49 to 80 inches (1,250 to 2,030 millimeters)
Mean annual temperature: 50 to 59 degrees F (10 to 15 degrees C)
Frost-free season: 150 to 250 days
Taxonomic classification: Loamy-skeletal, mixed, superactive, mesic Humic
Dystrocherepts

Modal Pedon

Sidehill extremely gravelly sandy loam, in an area of Mooncreek-Noisy-Sidehill complex, 30 to 75 percent slopes, on a linear, east-facing slope of 48 percent, under a stand of Douglas-fir, tanoak, Pacific madrone, and salal, at an elevation of 2,100 feet (645 meters); Humboldt County, California; USGS Hupa Mountain quadrangle; UTM zone 10, 434323mE, 4541699mN, NAD83.

Oi—0 to 2 inches (0 to 4 centimeters); very dark gray (10YR 3/1) slightly decomposed plant material consisting of needles and leaves of Douglas-fir and tanoak, black (10YR 2/1) moist; about 100 percent fiber unrubbed, 80 percent rubbed; loose,

- nonsticky and nonplastic; few very fine roots; common fine irregular pores; moderately acid (pH 5.6); abrupt smooth boundary.
- Oe—2 to 6 inches (4 to 15 centimeters); very dark gray (10YR 3/1) moderately decomposed plant material consisting of needles and leaves of Douglas-fir and tanoak, black (10YR 2/1) moist; about 100 percent fiber unrubbed, 30 percent rubbed; loose, nonsticky and nonplastic; few very fine roots; common fine irregular pores; moderately acid (pH 5.6); abrupt smooth boundary.
- A1—6 to 10 inches (15 to 25 centimeters); dark grayish brown (10YR 4/2) extremely gravelly sandy loam, black (10YR 2/1) moist; moderate very fine and fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine to very coarse roots; many very fine and fine tubular and irregular pores; 65 percent gravel and 5 percent cobbles; strongly acid (pH 5.4); clear wavy boundary.
- A2—10 to 18 inches (25 to 45 centimeters); dark grayish brown (10YR 4/2) extremely gravelly sandy loam, black (10YR 2/1) moist; strong very fine and fine subangular blocky structure parting to strong very fine granular; slightly hard, very friable, nonsticky and nonplastic; many very fine to very coarse roots; many very fine and fine tubular pores; 55 percent gravel and 5 percent cobbles; strongly acid (pH 5.2); clear wavy boundary.
- Bw—18 to 33 inches (45 to 85 centimeters); brown (10YR 4/3) very gravelly loam, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine to very coarse roots; many very fine interstitial and many fine tubular pores; 40 percent gravel and 5 percent cobbles; very strongly acid (pH 4.8); abrupt irregular boundary.
- 2R—34 inches (85 centimeters); indurated sandstone with fractures 15 to 25 centimeters apart.

Range in Characteristics

Depth to hard bedrock: 20 to 40 inches (50 to 100 centimeters)

Control section (by weighted average): 18 to 25 percent clay, 35 to 55 percent gravel, and 5 to 30 percent cobbles

Water table: None noted

Reaction: Moderately acid to very strongly acid

Surface fragments: 15 to 55 percent gravel and 5 to 25 percent cobbles

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly or moderately decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 10YR or 2.5Y

Value: 3 to 5 dry, 2 or 3 moist

Chroma: 2 to 4 dry, 1 to 3 moist

Texture of the fine-earth fraction: Sandy loam or loam

Content of clay: 10 to 25 percent

Rock fragments: 15 to 75 percent gravel and 0 to 35 percent cobbles

Bw horizon

Hue: 10YR or 2.5Y

Value: 3 to 6 dry or moist

Chroma: 1 to 6 dry or moist

Texture of the fine-earth fraction: Loam

Content of clay: 10 to 25 percent

Rock fragments: 35 to 55 percent gravel and 5 to 30 percent cobbles

Sisterrocks Series

Setting

Landscape position: Mountain slopes and hillslopes

Parent material: Colluvium and residuum derived from sandstone and mudstone

Slope: 15 to 75 percent

Elevation: 5 to 1,850 feet (2 to 565 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderately slow

Mean annual precipitation: 65 to 90 inches (1,650 to 2,290 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 250 to 325 days

Taxonomic classification: Loamy-skeletal, mixed, superactive, isomesic Typic Palehumults

Modal Pedon

Sisterrocks loam, in an area Sasquatch-Sisterrocks-Ladybird complex, 30 to 50 percent slopes, on a uniform southeast-facing slope of 40 percent, under redwood, Douglas-fir, western hemlock, California huckleberry, and swordfern, at an elevation of 880 feet (268 meters); in Del Norte Redwoods State Park, Del Norte County, California; USGS Childs Hill quadrangle; UTM zone 10, 407137mE, 4613395mN, NAD83.

- A1—0 to 9 inches (0 to 22 centimeters); very dark brown (10YR 2/2) loam, brown (10YR 5/3) dry; moderate very fine subangular blocky and moderate fine granular structure; slightly hard, firm, slightly sticky and slightly plastic; common very fine, fine, and medium roots; many very fine and fine interstitial and tubular pores; 5 percent gravel; strongly acid (pH 5.2); clear smooth boundary.
- A2—9 to 16 inches (22 to 40 centimeters); dark brown (10YR 3/3) gravelly clay loam, yellowish brown (10YR 5/4) dry; moderate very fine and fine subangular blocky structure; slightly hard, firm, slightly sticky and moderately plastic; common very fine, fine, medium, and coarse roots; many very fine and fine interstitial and many very fine, fine, and medium tubular pores; 25 percent gravel; very strongly acid (pH 4.9); clear smooth boundary.
- Bt1—16 to 24 inches (40 to 61 centimeters); dark yellowish brown (10YR 4/4) very gravelly clay loam, light yellowish brown (10YR 6/4) dry; moderate very fine and fine subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; few distinct clay films on faces of peds; common very fine, fine, medium, and coarse roots; common very fine and fine interstitial and common very fine, fine, and medium tubular pores; 35 percent gravel; very strongly acid (pH 4.7); clear smooth boundary.
- Bt2—24 to 31 inches (61 to 79 centimeters); strong brown (7.5YR 5/6) very gravelly clay loam, brownish yellow (10YR 6/6) dry; moderate fine and medium subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; few distinct clay films on faces of peds and rock fragments; moderately few very fine and common fine and medium roots; common very fine and fine interstitial and common very fine, fine, and medium tubular pores; 35 percent gravel; very strongly acid (pH 4.5); clear smooth boundary.
- Bt3—31 to 41 inches (79 to 105 centimeters); strong brown (7.5YR 4/6) very gravelly clay loam, brownish yellow (10YR 6/6) dry; moderate fine and medium subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; few distinct clay films on faces of peds and rock fragments; moderately few very

fine and fine roots; common very fine and fine interstitial and tubular pores; 40 percent gravel; very strongly acid (pH 4.5); clear smooth boundary.

Bt4—41 to 55 inches (105 to 140 centimeters); strong brown (7.5YR 4/6) very gravelly silty clay loam, brownish yellow (10YR 6/6) dry; moderate medium and weak coarse subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; few distinct clay films on faces of peds and rock fragments; moderately few very fine and fine roots; common very fine and fine interstitial and tubular pores; 40 percent gravel; very strongly acid (pH 4.5); clear wavy boundary.

Bt5—55 to 67 inches (140 to 170 centimeters); strong brown (7.5YR 4/6) very gravelly silty clay loam, brownish yellow (10YR 6/6) dry; moderate medium and weak coarse subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; few distinct clay films on faces of peds and rock fragments; very few very fine roots; common very fine and fine interstitial and moderately few very fine and fine tubular pores; 45 percent gravel, 5 percent cobbles, and 5 percent paragravel; very strongly acid (pH 4.5).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 27 to 35 percent clay, 35 to 75 percent gravel, 0 to 15 percent cobbles, and 0 to 5 percent paragravel

Water table: None noted

Reaction: Moderately acid to very strongly acid

O horizon (where present)

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 10YR

Value: 4 or 5 dry, 2 or 3 moist

Chroma: 2 to 4 dry, 1 to 3 moist

Texture of the fine-earth fraction: Loam and clay loam

Content of clay: 20 to 27 percent

Rock fragments: 5 to 30 percent gravel and 0 to 5 percent cobbles

Bt horizon

Hue: 7.5YR or 10YR

Value: 5 to 7 dry, 3 to 5 moist

Chroma: 4 to 6 dry or moist

Texture of the fine-earth fraction: Sandy clay loam, loam, clay loam, or silty clay loam

Content of clay: 23 to 35 percent

Rock fragments: 35 to 75 percent gravel and 0 to 15 percent cobbles

Pararock fragments: 0 to 5 percent paragravel

C horizon (where present)

Hue: 7.5YR, 10YR, or 2.5Y

Value: 6 to 8 dry, 4 to 6 moist

Chroma: 3 to 5 dry, 5 to 7 moist

Texture of the fine-earth fraction: Loam, clay loam, or silty clay loam

Content of clay: 23 to 35 percent

Rock fragments: 40 to 70 percent gravel and 5 to 25 percent cobbles

Pararock fragments: 0 to 20 percent paragravel and 0 to 7 percent paracobbles

Slidecreek Series

Setting

Landscape position: Mountain slopes

Parent material: Colluvium and residuum derived from sandstone, mudstone, and siltstone

Slope: 9 to 75 percent

Elevation: 80 to 2,520 feet (24 to 768 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderately slow or moderate

Mean annual precipitation: 70 to 100 inches (1,780 to 2,550 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 240 to 290 days

Taxonomic classification: Loamy-skeletal, mixed, semiactive, isomesic Typic Palehumults

Modal Pedon

Slidecreek gravelly loam, in an area of Coppercreek-Slidecreek-Tectah complex, 30 to 50 percent slopes, on a convex, northeast-facing slope of 30 percent, under Douglas-fir, redwood, tanoak, red alder, Pacific rhododendron, California huckleberry, red huckleberry, salal, and swordfern, at an elevation of 600 feet (183 meters); in Redwood National and State Parks, Del Norte County, California; USGS Childs Hill quadrangle; UTM zone 10, 407283mE, 4619811mN, NAD83.

A—0 to 7 inches (0 to 18 centimeters); very dark grayish brown (10YR 3/2) gravelly loam, brown (10YR 5/3) dry; moderate very fine and fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine and common medium and coarse roots; many very fine and fine irregular and common very fine, fine, and medium tubular pores; 30 percent gravel; strongly acid (pH 5.3); clear wavy boundary.

BAt—7 to 14 inches (18 to 36 centimeters); dark yellowish brown (10YR 4/4) very gravelly loam, pale brown (10YR 6/3) dry; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine and common medium and coarse roots; many very fine and fine irregular and common very fine, fine, and medium tubular pores; few distinct clay films on faces of peds and on rock fragments; 45 percent gravel; very strongly acid (pH 5.0); clear wavy boundary.

Bt1—14 to 24 inches (36 to 61 centimeters); brown (10YR 4/3) very gravelly clay loam, light yellowish brown (10YR 6/4) dry; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; many very fine and fine, common medium and coarse, and few very coarse roots; many very fine and fine irregular and common very fine, fine, coarse, and very coarse tubular pores; few distinct clay films on faces of peds and on rock fragments; 45 percent gravel; very strongly acid (pH 4.8); clear smooth boundary.

Bt2—24 to 37 inches (61 to 93 centimeters); dark yellowish brown (10YR 4/4) very gravelly clay loam, light yellowish brown (10YR 6/4) dry; moderate fine and medium subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; common very fine, fine, medium, and coarse roots; many very fine and fine irregular and common very fine, fine, and medium tubular pores; few distinct clay films on faces of peds and on rock fragments; 50 percent gravel; very strongly acid (pH 4.6); clear smooth boundary.

Bt3—37 to 50 inches (93 to 127 centimeters); dark yellowish brown (10YR 4/4) very gravelly clay loam, light yellowish brown (10YR 6/4) dry; moderate fine and weak

medium subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; common very fine, fine, medium, coarse, and very coarse roots; many very fine and fine irregular and common very fine, fine, and medium tubular pores; few distinct clay films on faces of peds and on rock fragments; 50 percent gravel; very strongly acid (pH 4.5); clear smooth boundary.

Bt4—50 to 61 inches (127 to 155 centimeters); dark yellowish brown (10YR 4/4) very gravelly clay loam, light yellowish brown (10YR 6/4) dry; weak fine and medium subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; moderately few fine and common medium and coarse roots; common very fine and fine irregular and tubular pores; few distinct clay films on faces of peds and on rock fragments; 45 percent gravel and 3 percent cobbles; very strongly acid (pH 4.5); clear smooth boundary.

BCt—61 to 79 inches (155 to 200 centimeters); dark yellowish brown (10YR 4/4) extremely gravelly clay loam, light yellowish brown (10YR 6/4) dry; weak fine and medium subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; moderately few very fine and common fine roots; common very fine and fine irregular and common fine tubular pores; few distinct clay films on faces of peds and on rock fragments; 50 percent gravel and 10 percent cobbles; very strongly acid (pH 4.5).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 25 to 35 percent clay, 35 to 80 percent gravel, 0 to 40 percent cobbles, and 0 to 20 percent stones

Water table: None noted

Reaction: Moderately acid to very strongly acid

O horizon (where present)

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 7.5YR or 10YR

Value: 5 or 6 dry, 3 or 4 moist

Chroma: 2 to 4 dry or moist

Texture of the fine-earth fraction: Loam

Content of clay: 20 to 27 percent

Rock fragments: 15 to 90 percent gravel and 0 to 10 percent cobbles

Bt horizon

Hue: 10YR or 2.5Y

Value: 6 to 8 dry, 4 or 5 moist

Chroma: 2 to 4 dry, 3 to 6 moist

Texture of the fine-earth fraction: Clay loam or silty clay loam

Content of clay: 27 to 35 percent

Rock fragments: 35 to 65 percent gravel, 0 to 10 percent cobbles, and 0 to 20 percent stones

C horizon (where present)

Hue: 10YR or 2.5Y

Value: 6 to 8 dry, 4 or 5 moist

Chroma: 2 to 4 dry, 3 to 6 moist

Texture of the fine-earth fraction: Loam or clay loam

Content of clay: 20 to 40 percent

Rock fragments: 40 to 80 percent gravel, 5 to 40 percent cobbles, and 0 to 10 percent stones

Squashan Series

Setting

Landscape position: Mountain slopes, hillslopes, and narrow ridges

Parent material: Colluvium and residuum from weakly consolidated fluvial and beach deposits derived from mixed sources

Slope: 9 to 50 percent

Elevation: 15 to 1,945 feet (6 to 593 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderately slow or moderate

Mean annual precipitation: 60 to 90 inches (1,520 to 2,290 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 240 to 325 days

Taxonomic classification: Loamy-skeletal, isotic, isomesic Typic Haplohumults

Modal Pedon

Squashan loam, in an area of Ossagon-Goldbluffs-Squashan complex, 9 to 30 percent slopes, on a convex, southwest-facing slope of 12 percent, under redwood, Douglas-fir, tanoak, California huckleberry, Pacific rhododendron, California huckleberry, salmonberry, salal, swordfern, and redwood-sorrel, at an elevation of 360 feet (110 meters); in Prairie Creek Redwoods State Park, Humboldt County, California; USGS Fern Canyon quadrangle; UTM zone 10, 415889mE, 4580993mN, NAD83.

Oi—0 to 2 inches (0 to 5 centimeters); very dark brown (10YR 2/2) fresh and slightly decomposed conifer needles, tanoak leaves, and twigs, brown (10YR 5/3) dry; common fine and few medium roots.

A1—2 to 9 inches (5 to 22 centimeters); very dark grayish brown (10YR 3/2) loam, brown (10YR 4/3) dry; moderate medium granular and fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine and few medium roots; common very fine and fine tubular and interstitial pores; 10 percent well rounded pebbles; moderately acid (pH 5.8); clear smooth boundary.

A2—9 to 17 inches (22 to 43 centimeters); dark brown (10YR 3/3) gravelly loam, brown (10YR 5/3) dry; moderate very fine and fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine, and medium and few coarse and very coarse roots; common very fine and fine tubular and interstitial and few medium tubular pores; 20 percent well rounded pebbles and 5 percent well rounded cobbles; moderately acid (pH 5.8); clear wavy boundary.

Bt1—17 to 33 inches (43 to 83 centimeters); brown (7.5YR 4/4) very gravelly clay loam, strong brown (7.5YR 5/6) dry; weak fine subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; common very fine, fine, and very coarse and few medium and coarse roots; common very fine and fine tubular and interstitial pores; few distinct clay films on faces of peds and rock faces; 45 percent well rounded pebbles and 10 percent well rounded cobbles; strongly acid (pH 5.4); clear wavy boundary.

Bt2—33 to 47 inches (83 to 120 centimeters); brown (7.5YR 4/4) very gravelly clay

loam, strong brown (7.5YR 5/6) dry; moderate fine subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; common very fine and fine and few medium, coarse, and very coarse roots; common very fine and fine tubular and interstitial pores; few distinct clay films on faces of peds and rock faces; 40 percent well rounded pebbles and 10 percent well rounded cobbles; strongly acid (pH 5.4); clear wavy boundary.

Bt3—47 to 65 inches (120 to 165 centimeters); strong brown (7.5YR 5/8) extremely gravelly sandy loam, brownish yellow (10YR 6/6) dry; moderate fine subangular blocky structure; slightly hard, firm, slightly sticky and slightly plastic; few fine roots; common very fine and fine tubular and interstitial pores; common distinct clay films on faces of peds and few distinct clay films on rock faces; 55 percent well rounded pebbles and 5 percent well rounded cobbles; strongly acid (pH 5.4); clear wavy boundary.

Bc1—65 to 79 inches (165 to 200 centimeters); yellowish brown (10YR 5/6) extremely gravelly sandy loam, yellow (10YR 7/6) dry; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few fine roots; common very fine and fine interstitial pores; few distinct clay films on faces of peds and rock faces; 60 percent well rounded pebbles, 5 percent well rounded cobbles, and 10 percent paragravel; moderately acid (pH 5.6).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 18 to 30 percent clay, 35 to 70 percent gravel, and 0 to 10 percent cobbles

Water table: None noted

Reaction: Moderately acid or strongly acid

Surface fragments: 0 to 30 percent gravel and 0 to 30 percent cobbles

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 7.5YR or 10YR

Value: 3 to 5 dry, 3 or 4 moist

Chroma: 2 or 3 dry or moist

Texture of the fine-earth fraction: Loam

Content of clay: 15 to 25 percent

Rock fragments: 10 to 35 percent gravel and 0 to 5 percent cobbles

Bt horizon

Hue: 7.5YR or 10YR

Value: 4 to 6 dry, 4 to 7 moist

Chroma: 4 to 8 dry or moist

Texture of the fine-earth fraction: Sandy loam, loam, sandy clay loam, or clay loam

Content of clay: 18 to 30 percent

Rock fragments: 35 to 70 percent gravel and 0 to 10 percent cobbles

C horizon (where present)

Hue: 10YR or 2.5Y

Value: 5 to 7 dry, 4 to 6 moist

Chroma: 3 to 6 dry or moist

Texture of the fine-earth fraction: Sand, loamy sand, or sandy loam

Content of clay: 0 to 10 percent

Rock fragments: 35 to 70 percent gravel, 0 to 10 percent cobbles, and 0 to 5 percent stones

Pararock fragments: 0 to 20 percent paragravel

Stonehill Series

Setting

Landscape position: Ridges and convex mountain slopes

Parent material: Colluvium and residuum derived from schist

Slope: 30 to 50 percent

Elevation: 15 to 1,770 feet (5 to 541 meters)

Depth class: Moderately deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderately slow or moderate

Mean annual precipitation: 70 to 85 inches (1,780 to 2,160 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 250 to 300 days

Taxonomic classification: Fine-loamy, mixed, superactive, isomesic Typic Haplohumults

Modal Pedon

Stonehill cobbly silt loam, in an area of Ladybird-Stonehill complex, 30 to 50 percent slopes, on a convex, northeast-facing slope of 42 percent, under Sitka spruce, red alder, redwood, and salmonberry, at an elevation of 700 feet (213 meters); in Redwood National Park, Humboldt County, California; USGS Orick quadrangle; UTM zone 10, 409443mE, 4569446mN, NAD83.

Oi—0 to 1 inch (0 to 3 centimeters); fresh and slightly decomposed red alder leaves, Sitka spruce needles, cones, and twigs.

Oa—1 to 5 inches (3 to 13 centimeters); mostly decomposed fine organic matter and humus; many very fine, common fine, and few medium roots; abrupt wavy boundary.

A1—5 to 13 inches (13 to 32 centimeters); very dark brown (10YR 2/2) cobbly silt loam, dark brown (10YR 3/3) dry; weak fine granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine and common medium and coarse roots; many very fine irregular and common very fine and fine and few medium tubular pores; 11 percent gravel and 10 percent cobbles; very strongly acid (pH 4.6); gradual smooth boundary.

A2—13 to 20 inches (32 to 52 centimeters); dark brown (7.5YR 3/2) cobbly silt loam, brown (10YR 4/3) dry; weak fine and medium subangular blocky structure; soft, friable, slightly sticky and slightly plastic; many very fine and common fine, medium, and coarse roots; common very fine irregular and common very fine, fine, and medium tubular pores; 17 percent gravel and 15 percent cobbles; very strongly acid (pH 4.8); clear wavy boundary.

BAt—20 to 25 inches (52 to 64 centimeters); dark brown (7.5YR 3/4) cobbly silty clay loam, yellowish brown (10YR 5/4) dry; weak medium and coarse subangular blocky structure; soft, friable, slightly sticky and slightly plastic; common very fine and fine and few medium and coarse roots; common very fine and fine and few medium tubular pores; 11 percent gravel and 10 percent cobbles; very strongly acid (pH 5.0); clear irregular boundary.

Bt—25 to 32 inches (64 to 82 centimeters); dark yellowish brown (10YR 4/4) gravelly

silty clay loam, light yellowish brown (10YR 6/4) dry; weak medium and coarse subangular blocky structure; slightly hard, friable, moderately sticky and slightly plastic; common very fine, fine, and medium and few coarse roots; common very fine and few fine tubular pores; few faint clay films on faces of peds and coating gravel in lower part; 25 percent gravel; very strongly acid (pH 4.9); clear wavy boundary.

R—32 inches (82 centimeters); weathered schist, fragments removable with a knife or spade and becoming harder with depth; fingers of soil in joints in the upper part; joint spacing of 2 to 4 inches (5 to 10 centimeters); few very fine and fine roots in joints; depth to upper boundary ranges from 29 to 38 inches (73 to 97 centimeters) within the pit.

Range in Characteristics

Bedrock: At a depth of 20 to 40 inches (50 to 100 centimeters)

Control section (by weighted average): 25 to 35 percent clay, 15 to 30 percent gravel, and 0 to 10 percent cobbles

Water table: None noted

Reaction: Very strongly acid

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly to highly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 7.5YR or 10YR

Value: 3 or 4 dry, 2 or 3 moist

Chroma: 3 or 4 dry, 2 or 3 moist

Texture of the fine-earth fraction: Silt loam

Content of clay: 12 to 20 percent

Rock fragments: 5 to 20 percent gravel and 0 to 15 percent cobbles

Bt horizon

Hue: 7.5YR or 10YR

Value: 5 or 6 dry, 3 or 4 moist

Chroma: 4 dry or moist

Texture of the fine-earth fraction: Silt loam, clay loam, or silty clay loam

Content of clay: 25 to 35 percent

Rock fragments: 15 to 30 percent gravel and 0 to 10 percent cobbles

Pararock fragments: 0 to 20 percent paragravel

Surpur Series

Setting

Landscape position: Ridges and upper mountain slopes

Parent material: Colluvium and residuum from weakly consolidated fluvial, beach, and dune deposits

Slope: 2 to 30 percent

Elevation: 760 to 2,260 feet (233 to 690 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderately slow

Mean annual precipitation: 70 to 100 inches (1,780 to 2,550 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 240 to 280 days

Taxonomic classification: Fine-loamy, mixed, semiactive, isomesic Typic Haplohumults

Modal Pedon

Surpur gravelly loam, in an area of Surpur-Mettah complex, 9 to 30 percent slopes, on a slightly convex, east-facing slope of 10 percent, under redwood, Douglas-fir, tanoak, California huckleberry, Pacific rhododendron, and salal, at an elevation of 1,770 feet (540 meters); in Redwood National Park, Humboldt County, California; USGS Holter Ridge quadrangle; UTM zone 10, 420205mE, 4573981mN, NAD83.

- Oi—0 to 4 inches (0 to 10 centimeters); dark brown (10YR 3/3) fresh and slightly decomposed conifer needles, tanoak leaves, and twigs, yellowish brown (10YR 5/4) dry; many very fine and fine and few medium roots; many very fine and fine interstitial pores; strongly acid (pH 5.0); abrupt smooth boundary.
- A—4 to 12 inches (10 to 31 centimeters); dark brown (10YR 3/3) gravelly loam, yellowish brown (10YR 5/4) dry; weak medium granular and very fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and fine and few medium roots; common very fine and fine tubular pores; 20 percent well rounded pebbles; slightly acid (pH 6.2); abrupt wavy boundary.
- Bt1—12 to 19 inches (31 to 47 centimeters); strong brown (7.5YR 4/6) gravelly clay loam, strong brown (7.5YR 5/6) dry; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; common very fine and fine and few medium roots; common very fine and fine irregular and common very fine and fine tubular pores; few faint clay films on faces of peds; 20 percent well rounded pebbles; slightly acid (pH 6.2); clear smooth boundary.
- Bt2—19 to 28 inches (47 to 72 centimeters); strong brown (7.5YR 4/6) clay loam, strong brown (7.5YR 5/6) dry; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; common very fine, fine, and medium and few coarse roots; common very fine and fine and few medium tubular pores; few faint clay films on faces of peds; 10 percent well rounded pebbles; moderately acid (pH 5.6); gradual wavy boundary.
- Bt3—28 to 41 inches (72 to 103 centimeters); strong brown (7.5YR 5/6) clay loam, reddish yellow (7.5YR 6/8) dry; moderate medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; common very fine, fine, and medium and few coarse roots; common very fine and fine and few medium tubular pores; few faint clay films on surfaces of peds and on rock fragments; 10 percent well rounded pebbles; moderately acid (pH 5.6); clear smooth boundary.
- Bt4—41 to 51 inches (103 to 130 centimeters); strong brown (7.5YR 5/6) fine sandy loam, reddish yellow (7.5YR 6/8) dry; weak medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and fine and few medium roots; common very fine and fine and few medium tubular pores; common distinct clay films between sand grains and few faint clay films on faces of peds; 10 percent well rounded pebbles; moderately acid (pH 5.6); gradual wavy boundary.
- Bct—51 to 63 inches (130 to 159 centimeters); strong brown (7.5YR 5/6) fine sandy loam, reddish yellow (7.5YR 6/8) dry; weak medium and coarse subangular blocky structure; soft, very friable, nonsticky and nonplastic; few very fine and fine and common medium roots; common very fine and fine tubular pores; few distinct clay films bridging sand grains; 2 percent well rounded pebbles; few fine bands of reddish brown (2.5YR 4/4) lamellae, 5 to 15 millimeters thick; strongly acid (pH 5.4); clear wavy boundary.

C—63 to 79 inches (159 to 200 centimeters); yellowish brown (10YR 5/8) loamy sand, brownish yellow (10YR 6/8) dry; massive; loose, nonsticky and nonplastic; few very fine and fine and common medium and coarse roots; common very fine and fine interstitial pores; 2 percent well rounded pebbles; few fine bands of yellowish red (5YR 5/8) lamellae, 1 to 4 millimeters thick; strongly acid (pH 5.4).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 27 to 32 percent clay and 0 to 15 percent gravel

Water table: None noted

Reaction: Moderately acid to very strongly acid

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 7.5YR or 10YR

Value: 4 to 6 dry, 3 or 4 moist

Chroma: 3 to 6 dry or moist

Texture of the fine-earth fraction: Loam

Content of clay: 12 to 25 percent

Rock fragments: 0 to 25 percent gravel

Bt horizon

Hue: 7.5YR or 10YR

Value: 5 or 6 dry, 3 to 6 moist

Chroma: 4 to 8 dry or moist

Texture of the fine-earth fraction: Fine sandy loam, loam, clay loam, or silty clay loam

Content of clay: 15 to 35 percent

Rock fragments: 0 to 30 percent gravel

C horizon

Hue: 7.5YR or 10YR

Value: 5 to 7 dry, 4 to 6 moist

Chroma: 4 to 8 dry or moist

Texture of the fine-earth fraction: Loamy sand or fine sandy loam

Content of clay: 0 to 18 percent

Rock fragments: 0 to 20 percent gravel and 0 to 25 percent paragravel

The Surpur soils in map unit 588 are taxadjuncts to the series. These soils have an ustic soil moisture regime. This difference, however, does not affect use and management.

Swainslough Series

Setting

Landscape position: Backswamps, depressions, low flood-plain steps, and reclaimed salt marshes

Parent material: Alluvium derived from mixed sources

Slope: 0 to 2 percent

Soil Survey of Redwood National and State Parks, California

Elevation: 0 to 160 feet (0 to 50 meters)

Depth class: Very deep

Drainage class: Very poorly drained

Slowest saturated hydraulic conductivity: Moderately low

Slowest permeability: Slow

Flooding: Occasional

Ponding: Frequent

Mean annual precipitation: 35 to 80 inches (890 to 2,030 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 275 to 330 days

Taxonomic classification: Fine, mixed, superactive, nonacid, isomesic Fluvaquentic Endoaquepts

Modal Pedon

Swainslough peat, in an area of Swainslough, 0 to 2 percent slopes, on a slope of less than 1 percent, under silverweed cinquefoil, spike bentgrass, and pasture grasses, at an elevation of 7 feet (2 meters); Humboldt County, California; USGS Ferndale quadrangle; UTM zone 10, 388940mE, 4494827mN, NAD83.

Oi—0 to 3 inches (0 to 8 centimeters); very dark grayish brown (10YR 3/2) peat, dark grayish brown (2.5Y 4/2) dry and dark yellowish brown (10YR 3/4) rubbed; 80 percent fibers unrubbed, 40 percent rubbed; neutral (pH 6.8); abrupt wavy boundary.

A—3 to 12 inches (8 to 30 centimeters); dark grayish brown (2.5Y 4/2) silty clay loam, light brownish gray (2.5Y 6/2) dry; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine to coarse roots; many very fine tubular pores; common fine prominent dark yellowish brown (10YR 4/4) iron-manganese masses in the matrix; neutral (pH 7.0); gradual wavy boundary.

Bg1—12 to 20 inches (30 to 51 centimeters); dark grayish brown (2.5Y 4/2) silty clay loam, light brownish gray (2.5Y 6/2) dry; moderate very fine and fine subangular blocky structure; hard, firm, moderately sticky and moderately plastic; many very fine to medium roots; common very fine tubular pores; common fine prominent dark yellowish brown (10YR 4/4) iron-manganese masses in the matrix; neutral (pH 7.0); gradual wavy boundary.

Bg2—20 to 29 inches (51 to 74 centimeters); dark grayish brown (2.5Y 4/2) silty clay loam, light brownish gray (2.5Y 6/2) dry; weak very fine and fine subangular blocky structure; hard, firm, moderately sticky and moderately plastic; common very fine to medium roots; common very fine tubular pores; many fine distinct gray (5Y 5/1) iron depletions and prominent dark yellowish brown (10YR 4/4) iron-manganese masses in the matrix; very few prominent strong brown (7.5YR 4/6) iron stains lining root channels and/or pores; neutral (pH 7.0); abrupt wavy boundary.

Bg3—29 to 38 inches (74 to 97 centimeters); dark grayish brown (2.5Y 4/2) silty clay loam, light brownish gray (2.5Y 6/2) dry; massive; hard, firm, moderately sticky and moderately plastic; common very fine and fine roots; common very fine tubular pores; many fine distinct gray (5Y 5/1) iron depletions and prominent dark yellowish brown (10YR 4/4) iron-manganese masses in the matrix; very few prominent strong brown (7.5YR 4/6) iron stains lining root channels and/or pores; slightly acid (pH 6.5); abrupt wavy boundary.

Bg4—38 to 65 inches (97 to 165 centimeters); dark gray (N 4/0) silty clay loam, gray (10YR 5/1) dry; massive; slightly hard, friable, slightly sticky and slightly plastic; few very fine and fine roots; common very fine tubular pores; very few medium prominent strong brown (7.5YR 4/6) iron stains lining root channels and/or pores; moderately acid (pH 6.0).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 35 to 45 percent clay

Water table: At a depth of 0 to 4 inches (0 to 10 centimeters) January through March, 6 to 24 inches (15 to 60 centimeters) in April, 12 to 35 inches (30 to 90 centimeters) May through June, 35 to greater than 72 inches (90 to greater than 183 centimeters) July through November, and 4 to 24 inches (10 to 60 centimeters) in December

O horizon

Hue: 10YR

Value: 3 or 4 dry or moist

Chroma: 2 to 4 dry or moist

Kind of organic material: Peat

Reaction: Neutral

A horizon

Hue: 10YR, 2.5Y, or 5Y

Value: 5 to 7 dry, 3 to 5 moist

Chroma: 2 to 4 dry or moist

Texture of the fine-earth fraction: Silty clay loam

Content of clay: 27 to 37 percent

Reaction: Moderately acid to neutral

Redoximorphic features:

Type—fine and medium masses of iron accumulation

Quantity—few or common

Hue—7.5YR or 10YR

Value—4 to 6 moist

Chroma—4 to 8 moist

Upper part of the Bg horizon

Hue: 10YR, 2.5Y, 5Y, or neutral

Value: 4 to 7 dry, 4 or 5 moist

Chroma: Neutral or 2 dry or moist

Texture of the fine-earth fraction: Silty clay loam or silty clay

Content of clay: 30 to 45 percent

Reaction: Moderately acid to slightly alkaline

Redoximorphic features:

Type—fine and medium iron-manganese masses in the matrix; iron stains lining root channels and/or pores

Quantity—few or common

Hue—10YR or 7.5YR

Value—4 to 6 moist

Chroma—4 to 8 moist

Type—medium iron depletions

Quantity—common or many

Hue—2.5Y or 5Y

Value—4 or 5 moist

Chroma—1 or 2 moist

Lower part of the Bg horizon

Hue: 10YR, 2.5Y, 5Y, or neutral

Value: 5 to 7 dry, 4 or 5 moist

Chroma: Neutral to 2 dry or moist

Texture of the fine-earth fraction: Silty clay loam or silty clay

Content of clay: 30 to 45 percent

Reaction: Moderately acid to slightly alkaline

Redoximorphic features:

Type—fine and medium iron-manganese masses in the matrix and iron stains lining root channels and/or pores

Quantity—few or common

Hue—7.5YR or 10YR

Value—4 to 6 moist

Chroma—4 to 6 moist

Type—medium iron depletions

Quantity—common or many

Hue—2.5Y or 5Y

Value—4 or 5 moist

Chroma—neutral to 2 moist

Talawa Series

Setting

Landscape position: Dissected marine terrace remnants

Parent material: Fluviomarine deposits derived from mixed sources

Slope: 0 to 2 percent

Elevation: 55 to 80 feet (18 to 25 meters)

Depth class: Very deep

Drainage class: Somewhat poorly drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderate

Mean annual precipitation: 60 to 80 inches (1,520 to 2,030 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 275 to 330 days

Taxonomic classification: Coarse-loamy, mixed, superactive, isomesic Oxyaquic Dystrudepts

Modal Pedon

Talawa fine sandy loam, in an area of Talawa, 0 to 2 percent slopes, on a uniform, northeast-facing slope of 2 percent, under sweet vernalgrass, velvetgrass, scattered Himalayan blackberry, California huckleberry, young Sitka spruce, and cascara, at an elevation of 69 feet (21 meters); in Jedediah Smith Redwoods State Park, Del Norte County, California; USGS Crescent City quadrangle; UTM zone 10, 404236mE, 4624827mN, NAD83.

Ap1—0 to 7 inches (0 to 18 centimeters); very dark brown (10YR 2/2) fine sandy loam, dark grayish brown (10YR 4/2) dry; moderate very fine and weak fine subangular blocky and moderate very fine granular structure; very friable, soft, slightly sticky and slightly plastic; many very fine and common fine roots; many very fine and fine tubular pores; strongly acid (pH 5.2); clear smooth boundary.

Ap2—7 to 12 inches (18 to 31 centimeters); very dark brown (10YR 2/2) fine sandy loam, brown (10YR 4/3) dry; moderate fine and medium subangular blocky and moderate fine granular structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; many very fine and fine tubular pores; 3 percent gravel and 1 percent cobbles; very strongly acid (pH 5.0); clear smooth boundary.

AB—12 to 17 inches (31 to 43 centimeters); 70 percent very dark grayish brown (10YR 3/2) and 30 percent dark yellowish brown (10YR 4/6) fine sandy loam, brown (10YR 4/3) and yellowish brown (10YR 5/6) dry; moderate fine and weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic;

Soil Survey of Redwood National and State Parks, California

common very fine and fine roots; common very fine tubular and common very fine and fine irregular pores; 3 percent gravel; very strongly acid (pH 5.0); clear smooth boundary.

- Bw1—17 to 27 inches (43 to 68 centimeters); dark yellowish brown (10YR 4/6) sandy loam, yellowish brown (10YR 5/6) dry; moderate fine and weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine roots; common very fine tubular and common very fine and fine irregular pores; few fine distinct strong brown (7.5YR 5/8) masses of iron accumulation in the matrix; few fine prominent black (N 2.5/0) masses of manganese accumulations in the matrix; few fine distinct brown (10YR 5/3) iron depletions in the matrix; 2 percent gravel and 1 percent paragravel; strongly acid (pH 5.2); clear smooth boundary.
- Bw2—27 to 39 inches (68 to 100 centimeters); dark yellowish brown (10YR 4/6) sandy loam, yellowish brown (10YR 5/6) dry; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; moderately few very fine roots; many very fine irregular pores; few fine distinct strong brown (7.5YR 5/6) masses of iron accumulation in the matrix; common fine distinct brown (10YR 5/3) iron depletions in the matrix; 2 percent gravel and 2 percent paragravel; strongly acid (pH 5.2); clear smooth boundary.
- C1—39 to 53 inches (100 to 135 centimeters); yellowish brown (10YR 5/6) loamy sand, yellow (10YR 7/6) dry; massive; very friable, soft, nonsticky and slightly plastic; moderately few very fine roots; many very fine interstitial pores; common fine and medium prominent strong brown (7.5YR 5/8) masses of iron accumulation in the matrix; common fine and medium prominent black (N 2.5/0) masses of manganese accumulation in the matrix; many medium distinct grayish brown (10YR 5/2) iron depletions in the matrix; 1 percent gravel and 2 percent paragravel; strongly acid (pH 5.4); clear wavy boundary.
- C2—53 to 63 inches (135 to 160 centimeters); yellowish brown (10YR 5/4) loamy sand, very pale brown (10YR 7/4) dry; massive; very friable, soft, nonsticky and slightly plastic; many very fine interstitial pores; common fine and medium distinct strong brown (7.5YR 5/8) masses of iron accumulation in the matrix; many fine distinct grayish brown (10YR 5/2) iron depletions in the matrix; moderately acid (pH 5.6).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 10 to 18 percent clay and 0 to 7 percent gravel

Water table: At a depth of 43 to 100 centimeters (17 to 39 inches)

A or Ap horizon

Hue: 10YR or 2.5Y

Value: 3 to 5 dry, 2 or 3 moist

Chroma: 1 to 3 dry or moist

Texture of the fine-earth fraction: Fine sandy loam

Rock fragments: 0 to 7 percent gravel and 0 to 2 percent cobbles

Content of clay: 15 to 20 percent

Reaction: Strongly acid or very strongly acid

Bw horizon

Hue: 10YR or 2.5Y

Value: 5 to 7 dry, 4 to 6 moist

Chroma: 4 to 6 dry or moist

Tarquin Series

Setting

Landscape position: Dissected fan remnants

Parent material: Colluvium and residuum derived from weakly consolidated siltstone and conglomerate

Slope: 9 to 30 percent

Elevation: 160 to 645 feet (50 to 198 meters)

Depth class: Very deep

Drainage class: Moderately well drained

Slowest saturated hydraulic conductivity: Moderately low

Slowest permeability: Slow

Mean annual precipitation: 75 to 90 inches (1,900 to 2,290 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 275 to 325 days

Taxonomic classification: Fine-loamy, mixed, superactive, isomesic Oxyaquic Palehumults

Modal Pedon

Tarquin loam, in an area of Tarquin, 9 to 30 percent slopes, on a gentle, northeast-facing slope of 15 percent, under redwood, western hemlock, California huckleberry, red huckleberry, salal, salmonberry, Pacific rhododendron, swordfern, and redwood-sorrel, at an elevation of 420 feet (128 meters); in Jedediah Smith Redwoods State Park, Del Norte County, California; USGS Hiouchi quadrangle; UTM zone 10, 407020mE, 4625080mN, NAD83.

Oi—0 to 3 inches (0 to 8 centimeters); black (10YR 2/1) slightly decomposed needles, leaves, and twigs, dark brown (10YR 3/3) dry; loose, nonsticky and nonplastic; common very fine, fine, and medium roots; many very fine and fine interstitial

Soil Survey of Redwood National and State Parks, California

- pores; 35 percent wood fragments; very strongly acid (pH 4.5); clear smooth boundary.
- A1—3 to 8 inches (8 to 21 centimeters); dark brown (10YR 3/3) loam, brown (10YR 5/3) dry; moderate very fine and weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine and common medium roots; common very fine and fine tubular and many very fine and fine interstitial pores; 7 percent gravel; very strongly acid (pH 5.0); clear wavy boundary.
- A2—8 to 20 inches (21 to 51 centimeters); dark brown (10YR 3/3) loam, yellowish brown (10YR 5/4) dry; moderate very fine and weak fine subangular blocky structure; slightly hard, friable, slightly sticky and moderately plastic; common very fine, fine, medium, and coarse roots; common very fine and fine tubular and interstitial pores; 7 percent gravel and 3 percent paragravel; strongly acid (pH 5.2); clear wavy boundary.
- BA—20 to 24 inches (51 to 62 centimeters); dark yellowish brown (10YR 4/4) clay loam, light yellowish brown (10YR 6/4) dry; moderate fine and weak medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; common very fine, fine, medium, coarse, and very coarse roots; common very fine and fine tubular and interstitial pores; 3 percent gravel; strongly acid (pH 5.1); clear smooth boundary.
- Bt1—24 to 30 inches (62 to 77 centimeters); dark yellowish brown (10YR 4/4) clay loam, brownish yellow (10YR 6/6) dry; moderate fine subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; common fine, medium, coarse, and very coarse roots; common very fine and fine tubular and interstitial pores; 7 percent gravel and 3 percent paragravel; few distinct clay films on faces of peds and rock fragments; very strongly acid (pH 4.6); clear wavy boundary.
- Bt2—30 to 37 inches (77 to 93 centimeters); dark yellowish brown (10YR 4/4) silty clay loam, light yellowish brown (10YR 6/4) dry; moderate fine and weak medium subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; common very fine, fine, medium, coarse, and very coarse roots; common fine tubular and common very fine and fine interstitial pores; 3 percent gravel and 5 percent paragravel; few distinct clay films on faces of peds, rock fragments, and surfaces along root channels; common fine distinct dark yellowish brown (10YR 4/6) masses of iron accumulation throughout the matrix; common fine distinct gray (2.5Y 5/1) iron depletions throughout the matrix; very strongly acid (pH 4.5); clear smooth boundary.
- Bt3—37 to 50 inches (93 to 128 centimeters); yellowish brown (10YR 5/4) silty clay loam, very pale brown (10YR 7/4) dry; moderate medium and weak coarse subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; common fine, medium, coarse, and very coarse roots; moderately few very fine tubular and common very fine and fine interstitial pores; 3 percent gravel and 7 percent paragravel; few distinct clay films on faces of peds, rock fragments, and surfaces along root channels; common fine distinct dark yellowish brown (10YR 4/4) masses of iron accumulation throughout the matrix; common fine distinct grayish brown (2.5Y 5/2) iron depletions throughout matrix; very strongly acid (pH 4.5); clear smooth boundary.
- CBt—50 to 60 inches (128 to 152 centimeters); light olive brown (2.5Y 5/3) very paragravelly silty clay loam, pale yellow (2.5Y 7/4) dry; weak coarse subangular blocky structure; hard, very firm, moderately sticky and moderately plastic; common fine, medium, and coarse roots; moderately few very fine interstitial pores; 5 percent gravel and 40 percent paragravel; common fine distinct dark yellowish brown (10YR 4/4) masses of iron accumulation throughout the matrix;

common fine distinct grayish brown (2.5Y 5/2) iron depletions throughout the matrix; very strongly acid (pH 4.5).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 27 to 35 percent clay and 0 to 10 percent gravel

Water table: At a depth of 24 to 30 inches (60 to 80 centimeters)

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 10YR or 2.5Y

Value: 4 or 5 dry, 3 or 4 moist

Chroma: 3 or 4 dry, 2 to 4 moist

Texture of the fine-earth fraction: Loam

Content of clay: 20 to 27 percent

Rock fragments: 0 to 10 percent gravel and 0 to 5 percent paragravel

Reaction: Strongly acid or very strongly acid

Upper part of the Bt horizon

Hue: 7.5YR, 10YR, or 2.5Y

Value: 6 or 7 dry, 4 or 5 moist

Chroma: 4 to 6 dry or moist

Texture of the fine-earth fraction: Silty clay loam or clay loam

Content of clay: 27 to 35 percent

Rock fragments: 0 to 10 percent gravel and 0 to 5 percent paragravel

Reaction: Very strongly acid

Lower part of the Bt horizon

Hue: 7.5YR, 10YR, or 2.5Y

Value: 6 or 7 dry, 4 or 5 moist

Chroma: 4 to 6 dry or moist

Texture of the fine-earth fraction: Silty clay loam or clay loam

Content of clay: 35 to 40 percent

Rock fragments: 0 to 25 percent gravel and 0 to 10 percent paragravel

Reaction: Very strongly acid

Redoximorphic features:

Type—fine and medium masses of iron accumulation and iron depletions in the matrix

Quantity—common

Hue—7.5YR, 10YR, or 2.5Y

Value—4 to 6 moist

Chroma—1 to 8 moist

C horizon

Hue: 10YR or 2.5Y

Value: 6 or 7 dry, 4 or 5 moist

Chroma: 3 or 4 dry or moist

Texture of the fine-earth fraction: Silty clay loam

Content of clay: 30 to 40 percent

Rock fragments: 0 to 15 percent gravel and 0 to 40 percent paragravel

Reaction: Very strongly acid

Redoximorphic features:

Type—fine and medium masses of iron accumulation and iron depletions in the matrix

Quantity—common

Hue—7.5YR, 10YR, or 2.5Y

Value—4 to 6 moist

Chroma—1 to 8 moist

Tectah Series

Setting

Landscape position: Broad ridges and mountain slopes

Parent material: Colluvium and residuum derived from sandstone and mudstone

Slope: 0 to 50 percent

Elevation: 75 to 2,300 feet (24 to 702 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately low or low

Slowest permeability: Slow

Mean annual precipitation: 70 to 100 inches (1,780 to 2,550 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 240 to 280 days

Taxonomic classification: Fine, mixed, semiactive, isomesic Typic Palehumults

Modal Pedon

Tectah silty clay loam, in an area of Coppercreek-Tectah-Lacks creek complex, 30 to 50 percent slopes, on a slightly convex, south-facing slope of 35 percent, under redwood, western hemlock, Douglas-fir, tanoak, Pacific rhododendron, California huckleberry, and salal, at an elevation of 366 meters (1,200 feet); in Redwood National Park, Humboldt County, California; USGS Bald Hills quadrangle; UTM zone 10, 416908mE, 4565198mN, NAD83.

Oi—0 to 2 inches (0 to 5 centimeters); fresh and slightly decomposed leaves, twigs, and cones from redwood, Douglas-fir, tanoak, and hemlock.

A—2 to 12 inches (5 to 30 centimeters); dark yellowish brown (10YR 4/4) silty clay loam, yellowish brown (10YR 6/4) dry; strong medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine, and medium and few coarse roots; common very fine and fine irregular pores; 7 percent gravel; very strongly acid (pH 5.6); gradual smooth boundary.

BAt—12 to 21 inches (30 to 54 centimeters); strong brown (7.5YR 4/6) silty clay loam, reddish yellow (7.5YR 7/5) dry; strong medium subangular blocky structure; hard, friable, slightly sticky and slightly plastic; common very fine, fine, and medium and few coarse roots; common very fine tubular and irregular pores; few distinct clay films in pores and on faces of peds; 4 percent gravel; very strongly acid (pH 5.6); gradual smooth boundary.

Bt1—21 to 31 inches (54 to 79 centimeters); yellowish brown (10YR 5/6) silty clay, reddish yellow (7.5YR 7/6) dry; strong coarse subangular blocky structure; hard, friable, moderately sticky and moderately plastic; few very fine, fine, medium, and coarse roots; common very fine tubular and irregular pores; many distinct clay films on faces of peds and in pores; 9 percent gravel; very strongly acid (pH 5.2); diffuse smooth boundary.

Bt2—31 to 45 inches (79 to 115 centimeters); yellowish brown (10YR 5/8) silty clay,

Soil Survey of Redwood National and State Parks, California

yellow (10YR 7/6) dry; moderate coarse subangular blocky structure; hard, friable, moderately sticky and moderately plastic; few very fine, fine, and medium roots; common very fine and fine tubular and few fine irregular pores; common distinct clay films on faces of peds and in pores; 7 percent gravel; very strongly acid (pH 5.1); diffuse smooth boundary.

Bt3—45 to 61 inches (115 to 155 centimeters); yellowish brown (10YR 5/8) silty clay loam, yellow (10YR 7/6) dry; moderate coarse subangular blocky structure; hard, friable, moderately sticky and moderately plastic; few very fine, fine, and medium roots; common very fine tubular and irregular pores; common distinct clay films on faces of peds and in pores; 6 percent gravel; very strongly acid (pH 5.2); diffuse smooth boundary.

Bt4—61 to 73 inches (155 to 185 centimeters); yellowish brown (10YR 5/8) silty clay loam, yellow (10YR 7/6) dry; moderate coarse subangular blocky structure; hard, friable, moderately sticky and moderately plastic; few very fine, fine, and medium roots; common very fine tubular and irregular pores; common faint clay films on faces of peds and in pores; 8 percent gravel; very strongly acid (pH 5.1).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 35 to 50 percent clay, 0 to 30 percent gravel, and 0 to 3 percent cobbles

Water table: None noted

Reaction: Moderately acid to very strongly acid

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 7.5YR or 10YR

Value: 5 to 7 dry, 3 to 5 moist

Chroma: 3 to 6 dry or moist

Texture of the fine-earth fraction: Loam, silt loam, clay loam, or silty clay loam

Content of clay: 22 to 35 percent

Rock fragments: 0 to 13 percent gravel

Bt horizon

Hue: 7.5YR, 10YR, or 2.5Y

Value: 5 to 7 dry, 4 or 5 moist

Chroma: 4 to 6 dry, 4 to 8 moist

Texture of the fine-earth fraction: Clay loam, silty clay loam, silty clay, or clay

Content of clay: 35 to 50 percent

Rock fragments: 0 to 30 percent gravel and 0 to 3 percent cobbles

Pararock fragments: 0 to 7 percent paragravel

Tossup Series

Setting

Landscape position: Broad ridges and upper mountain slopes

Parent material: Colluvium and residuum derived from sandstone and mudstone

Slope: 9 to 50 percent

Soil Survey of Redwood National and State Parks, California

Elevation: 45 to 4,985 feet (15 to 1,520 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately low

Slowest permeability: Slow

Mean annual precipitation: 49 to 80 inches (1,250 to 2,030 millimeters)

Mean annual temperature: 50 to 59 degrees F (10 to 15 degrees C)

Frost-free season: 150 to 250 days

Taxonomic classification: Fine, mixed, semiactive, mesic Typic Palexerults

Modal Pedon

Tossup very gravelly loam, in an area of Mooncreek-Noisy-Tossup complex, 9 to 30 percent slopes, on a concave, east-facing slope of 10 percent, under Douglas-fir and tanoak, at an elevation of 3,785 feet (1,155 meters); on Kinsey Ridge, Humboldt County, California; USGS Board Camp Mountain quadrangle; UTM zone 10, 443035mE, 4509231mN, NAD83.

Oi—0 to 1 inch (0 to 2 centimeters); very dark gray (10YR 3/1) slightly decomposed plant material consisting of needles and leaves of Douglas-fir and tanoak, black (10YR 2/1) moist; about 100 percent fiber unrubbed, 80 percent rubbed; few very fine roots; many fine irregular pores; moderately acid (pH 5.6); abrupt smooth boundary.

A—1 to 8 inches (2 to 20 centimeters); yellowish brown (10YR 5/4) very gravelly loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure parting to moderate fine subangular blocky; soft, very friable, nonsticky and nonplastic; many very fine to medium and common coarse roots; many fine and medium and common coarse tubular pores; 50 percent gravel; very strongly acid (pH 4.6); clear smooth boundary.

Bt1—8 to 21 inches (20 to 53 centimeters); light yellowish brown (10YR 6/4) gravelly clay, yellowish brown (10YR 5/4) moist; strong fine and medium subangular blocky structure; hard, firm, very sticky and very plastic; many very fine and fine and common medium and coarse roots; many fine to coarse tubular pores; common faint clay films on all faces of peds; 25 percent gravel; very strongly acid (pH 4.8); clear smooth boundary.

Bt2—21 to 37 inches (53 to 95 centimeters); brownish yellow (10YR 6/6) gravelly clay, yellowish brown (10YR 5/6) moist; strong fine angular blocky structure; hard, very firm, very sticky and very plastic; many very fine to medium and common coarse roots; many fine and medium and common coarse tubular pores; many distinct clay films on all faces of peds; 20 percent gravel; very strongly acid (pH 4.8); clear smooth boundary.

Bt3—37 to 48 inches (95 to 123 centimeters); brownish yellow (10YR 6/6) silty clay, yellowish brown (10YR 5/6) moist; strong very fine angular blocky structure; hard, very firm, very sticky and very plastic; many fine and medium and common coarse roots; common medium tubular pores; many distinct clay films on all faces of peds; 10 percent gravel; very strongly acid (pH 5.0); clear smooth boundary.

BcT—48 to 79 inches (123 to 200 centimeters); brownish yellow (10YR 6/6) very gravelly clay, yellowish brown (10YR 5/6) moist; strong very fine angular blocky structure; hard, firm, very sticky and very plastic; common medium roots; common medium tubular pores; many distinct clay films on all faces of peds; 5 percent fine iron-manganese stains; 40 percent gravel and 40 percent paragravel; very strongly acid (pH 4.8).

Range in Characteristics

Trailhead Series

Setting

Landscape position: Broad ridges and upper mountain slopes
Parent material: Residuum and colluvium from schist and sandstone (fig. 24)
Slope: 0 to 50 percent
Elevation: 50 to 2,640 feet (15 to 805 meters)
Depth class: Very deep
Drainage class: Well drained
Slowest saturated hydraulic conductivity: Moderately low or low
Slowest permeability: Moderately slow or slow
Mean annual precipitation: 70 to 100 inches (1,780 to 2,550 millimeters)
Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)
Frost-free season: 240 to 290 days
Taxonomic classification: Fine, parasquesic, isomesic Typic Palehumults

Modal Pedon

Trailhead clay loam, in an area of Trailhead-Fortyfour complex, 30 to 50 percent slopes, on a convex, south-facing slope of 25 percent, under redwood, Douglas-fir, tanoak, western hemlock, California huckleberry, Pacific rhododendron, and Cascade barberry, at an elevation of 900 feet (274 meters); in Redwood National Park, Humboldt County, California; USGS Bald Hills quadrangle; UTM zone 10, 414809mE, 4562447mN, NAD83.

Oi—0 to 1 inch (0 to 2 centimeters); fresh and decomposed conifer needles and tanoak leaves and twigs; about 25 percent cover of surface gravel.

Figure 24.—A profile of a Trailhead soil. These very deep soils have distinctive strong red subsurface layers. They are on stable ridges and upper mountain slopes. Depth is marked in centimeters.

Soil Survey of Redwood National and State Parks, California

- A—1 to 5 inches (2 to 13 centimeters); dark brown (7.5YR 3/3) clay loam, brown (7.5YR 4/4) dry; moderate medium subangular blocky structure parting to moderate fine subangular blocky; slightly hard, friable, slightly sticky and slightly plastic; common very fine, many fine, and common medium roots; common very fine irregular and common very fine and fine tubular pores; common fine rounded yellowish red (5YR 5/6) iron-manganese nodules; about 3 percent rounded to subangular pebbles; moderately acid (pH 6.0); clear wavy boundary.
- AB—5 to 12 inches (13 to 30 centimeters); reddish brown (5YR 4/4) clay loam, reddish brown (5YR 5/4) dry; moderate medium subangular blocky structure parting to moderate fine subangular blocky; hard, friable, slightly sticky and moderately plastic; common fine and medium and few coarse roots; common very fine irregular and common very fine and fine tubular pores; common fine rounded yellowish red (5YR 5/6) iron-manganese nodules; about 2 percent gravel; moderately acid (pH 5.8); gradual wavy boundary.
- BAt—12 to 27 inches (30 to 68 centimeters); yellowish red (5YR 4/6) clay loam, yellowish red (5YR 5/6) dry; weak coarse subangular blocky structure parting to weak medium subangular blocky; slightly hard, firm, moderately sticky and moderately plastic; common fine, medium, and coarse roots; few very fine, fine, and medium tubular pores; few faint to distinct clay films in pores and on faces of peds; less than 2 percent gravel; moderately acid (pH 5.6); diffuse smooth boundary.
- Bt1—27 to 36 inches (68 to 92 centimeters); yellowish red (5YR 4/6) clay, yellowish red (5YR 5/6) dry; weak very coarse subangular blocky structure parting to weak medium subangular blocky; hard, firm, moderately sticky and very plastic; common fine, medium, and coarse roots; few very fine and fine tubular pores; few distinct clay films in pores and on faces of peds; less than 2 percent gravel; moderately acid (pH 5.7); diffuse smooth boundary.
- Bt2—36 to 66 inches (92 to 167 centimeters); red (2.5YR 4/6) clay, yellowish red (5YR 5/6) dry; weak very coarse subangular blocky structure; hard, firm, moderately sticky and very plastic; common fine and medium and few coarse roots; few very fine and fine tubular pores; common distinct clay films in pores and few distinct clay films on faces of peds; less than 2 percent gravel; moderately acid (pH 5.7); diffuse smooth boundary.
- Bt3—66 to 80 inches (167 to 202 centimeters); red (2.5YR 4/6) clay, yellowish red (5YR 5/6) dry; weak very coarse subangular blocky structure; hard, firm, moderately sticky and very plastic; few fine and medium roots; few very fine and fine tubular pores; common distinct clay films in pores and on faces of peds; about 10 percent gravel; moderately acid (pH 5.6).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 40 to 60 percent clay and 0 to 15 percent gravel

Water table: None noted

Reaction: Strongly acid or very strongly acid

Surface fragments: 0 to 5 percent gravel

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 5YR or 7.5YR

Value: 4 to 6 dry, 3 to 6 moist

Chroma: 3 or 4 dry, 2 to 4 moist

Texture of the fine-earth fraction: Loam, clay loam, or silty clay loam

Content of clay: 20 to 35 percent

Rock fragments: 0 to 25 percent gravel

Bt horizon

Hue: 2.5YR or 5YR

Value: 3 to 6 dry, 4 to 8 moist

Chroma: 3 to 8 dry, 6 to 8 moist

Texture of the fine-earth fraction: Silty clay loam, silty clay, or clay

Content of clay: 35 to 60 percent

Rock fragments: 0 to 30 percent gravel and 0 to 5 percent cobbles

Pararock fragments: 0 to 15 percent paragravel

C horizon (where present)

Hue: 2.5YR or 5YR

Value: 3 to 6 dry, 4 to 8 moist

Chroma: 3 to 8 dry, 6 to 8 moist

Texture of the fine-earth fraction: Silty clay loam, silty clay, or clay

Content of clay: 35 to 60 percent

Rock fragments: 35 to 50 percent gravel and 35 to 50 percent cobbles

Pararock fragments: 0 to 15 percent paragravel

The Trailhead soils in map units 561, 563, 583, and 586 are taxadjuncts to the series. These soils have an ustic soil moisture regime. This difference, however, does not affect use and management.

Tsunami Series

Setting

Landscape position: Fan terraces and fan remnants

Parent material: Alluvium derived from mixed sources

Slope: 2 to 9 percent

Elevation: 10 to 120 feet (4 to 38 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately low

Slowest permeability: Slow

Mean annual precipitation: 60 to 80 inches (1,520 to 2,030 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 300 to 365 days

Taxonomic classification: Fine-loamy, mixed, superactive, isomesic Fluventic Humic Dystrudepts

Modal Pedon

Tsunami gravelly loam, in an area of Tsunami, 2 to 9 percent slopes, on a linear, west-facing slope of 2 percent, under sweet vernalgrass, riggut brome, soft brome, fescue, velvetgrass, coyotebrush, and Himalayan blackberry, at an elevation of 55 feet (17 meters); Del Norte County, California; USGS Sisterrocks quadrangle; UTM zone 10, 404824mE, 4618761mN, NAD83.

A1—0 to 4 inches (0 to 11 centimeters); black (10YR 2/1) gravelly loam, very dark grayish brown (10YR 3/2) dry; weak very fine and fine subangular blocky and

- weak medium granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine and fine irregular and tubular pores; 20 percent gravel; strongly acid (pH 5.2); clear wavy boundary.
- A2—4 to 13 inches (11 to 32 centimeters); black (10YR 2/1) loam, very dark brown (10YR 2/2) dry; moderate very fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and common fine roots; common very fine and fine irregular and tubular pores; 5 percent gravel; strongly acid (pH 5.2); clear wavy boundary.
- A3—13 to 18 inches (32 to 46 centimeters); very dark brown (10YR 2/2) loam, dark grayish brown (10YR 4/2) dry; weak fine and moderate very fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine and fine irregular and common very fine, fine, and medium tubular pores; 5 percent gravel; strongly acid (pH 5.2); clear smooth boundary.
- Bw1—18 to 26 inches (46 to 66 centimeters); dark brown (10YR 3/3) loam, yellowish brown (10YR 5/4) dry; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; moderately few very fine and fine roots; common very fine and fine irregular and tubular pores; 10 percent gravel and 1 percent cobbles; strongly acid (pH 5.2); clear smooth boundary.
- Bw2—26 to 38 inches (66 to 97 centimeters); brown (10YR 4/3) gravelly loam, light yellowish brown (2.5Y 6/3) dry; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; very few very fine roots; common very fine and fine irregular and common very fine tubular pores; 25 percent gravel and 3 percent cobbles; strongly acid (pH 5.2); clear smooth boundary.
- BC—38 to 60 inches (97 to 152 centimeters); dark yellowish brown (10Y 4/4) very cobbly loam, light yellowish brown (2.5Y 6/4) dry; massive; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine irregular pores; 35 percent gravel and 20 percent cobbles; strongly acid (pH 5.2).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 18 to 25 percent clay, 10 to 30 percent gravel, and 0 to 5 percent cobbles

Water table: None noted

Reaction: Strongly acid

A horizon

Hue: 10YR or 2.5Y

Value: 2 to 4 dry or moist

Chroma: 2 dry, 1 or 2 moist

Texture of the fine-earth fraction: Loam

Content of clay: 18 to 27 percent

Rock fragments: 0 to 20 percent gravel

Bw horizon

Hue: 10YR or 2.5Y

Value: 4 to 7 dry, 3 or 4 moist

Chroma: 2 to 4 dry or moist

Texture of the fine-earth fraction: Sandy loam, clay loam, or loam

Content of clay: 18 to 28 percent

Rock fragments: 10 to 30 percent gravel and 0 to 5 percent cobbles

C horizon (where present)

Hue: 10YR or 2.5Y

Value: 6 or 7 dry, 3 or 4 moist

Chroma: 3 or 4 dry or moist

Texture of the fine-earth fraction: Sandy loam, sandy clay loam, loam, or clay

Content of clay: 18 to 40 percent

Rock fragments: 0 to 70 percent gravel and 10 to 30 percent cobbles

Ustic Palehumults

Setting

Landscape position: Mountain slopes

Parent material: Colluvium and residuum derived from dacite

Slope: 15 to 50 percent

Elevation: 1,530 to 2,025 feet (467 to 618 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately low

Slowest permeability: Moderately slow

Mean annual precipitation: 75 to 95 inches (1,900 to 2,410 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 250 to 260 days

Taxonomic classification: Loamy-skeletal, mixed, semiactive, isomesic Ustic Palehumults

Modal Pedon

Ustic Palehumults very gravelly loam, in an area of Ustic Palehumults, 15 to 50 percent slopes, on a uniform, northwest-facing slope of 31 percent with 55 percent gravel, 30 percent cobbles, and 5 percent stones on the surface, at an elevation of 2,000 feet (610 meters), under redwood, tanoak, Pacific madrone, and Douglas-fir; in Redwood National Park, Humboldt County, California; USGS Panthercreek Creek quadrangle; UTM zone 10, 419943mE, 4554884mN, NAD83.

Oi—0 to 3 inches (0 to 7 centimeters); fresh and slightly decomposed tanoak and madrone leaves, twigs, and bark; fungal mycelia at the mineral soil interface; gravel and cobble erosional pavement.

A—3 to 8 inches (7 to 19 centimeters); dark yellowish brown (10YR 3/4) very gravelly loam, brown (10YR 5/3) dry; moderate fine and medium granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine and common fine roots and few medium and coarse roots; many very fine and fine irregular and tubular pores; 40 percent gravel, 10 percent cobbles, and 5 percent stones; moderately acid (pH 6.0); abrupt wavy boundary.

AB—8 to 13 inches (19 to 33 centimeters); dark yellowish brown (10YR 4/4) gravelly loam, yellowish brown (10YR 5/4) dry; weak fine and medium granular and weak medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine and few medium and coarse roots; common very fine and fine and few medium and coarse tubular pores; 18 percent gravel, 10 percent cobbles, and 5 percent stones; moderately acid (pH 6.0); clear wavy boundary.

BA—13 to 20 inches (33 to 51 centimeters); yellowish brown (10YR 5/6) extremely gravelly silt loam, light yellowish brown (10YR 6/4) dry; weak medium and coarse subangular blocky structure; moderately hard, friable, slightly sticky and slightly plastic; common very fine, fine, medium, and coarse roots; common very fine and fine and few medium tubular pores; 30 percent gravel, 20 percent cobbles, and 10 percent stones; moderately acid (pH 6.0); clear wavy boundary.

Bt—20 to 42 inches (51 to 106 centimeters); yellowish brown (10YR 5/6) very cobbly silty clay loam, very pale brown (10YR 7/4) dry; moderate coarse subangular blocky structure; hard, firm, slightly sticky and slightly plastic; common very fine

Soil Survey of Redwood National and State Parks, California

and few fine, medium, and coarse roots; common very fine, fine, and medium and few coarse tubular pores; few faint clay films on faces of peds; 17 percent gravel, 25 percent cobbles, and 10 percent stones; slightly acid (pH 6.0); gradual wavy boundary.

BCt—42 to 57 inches (106 to 145 centimeters); yellowish brown (10YR 5/6) very cobbly silty clay loam, brownish yellow (10YR 6/6) dry; weak medium and coarse subangular blocky structure; hard, friable, moderately sticky and slightly plastic; few very fine, fine, and medium roots; common very fine and fine interstitial and few very fine and fine tubular pores; few faint clay films on faces of peds; 30 percent gravel, 30 percent cobbles, and 20 percent stones; slightly acid (pH 6.2); diffuse wavy boundary.

C—57 to 91 inches (145 to 232 centimeters); brownish yellow (10YR 6/6) extremely stony loam, very pale brown (10YR 7/4) dry; massive; slightly hard, friable, slightly sticky and slightly plastic; few very fine, fine, and medium roots; many very fine and fine interstitial pores; 25 percent gravel, 30 percent cobbles, and 25 percent stones; slightly acid (pH 6.2).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 27 to 35 percent clay, 35 to 60 percent gravel, 15 to 30 percent cobbles, and 0 to 10 percent stones

Water table: None noted

Reaction: Slightly acid to very strongly acid

Surface fragments: 30 to 85 percent gravel, 10 to 40 percent cobbles, and 0 to 10 percent stones

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 7.5YR or 10YR

Value: 5 or 6 dry, 3 or 4 moist

Chroma: 2 to 4 dry or moist

Texture of the fine-earth fraction: Loam

Content of clay: 20 to 27 percent

Rock fragments: 35 to 45 percent gravel, 0 to 10 percent cobbles, and 0 to 5 percent stones

Bt horizon

Hue: 10YR or 2.5Y

Value: 6 to 8 dry, 4 or 5 moist

Chroma: 2 to 4 dry, 3 to 6 moist

Texture of the fine-earth fraction: Clay loam or silty clay loam

Content of clay: 27 to 35 percent

Rock fragments: 15 to 60 percent gravel, 15 to 30 percent cobbles, and 0 to 10 percent stones

C horizon

Hue: 10YR or 2.5Y

Value: 6 to 8 dry, 4 to 6 moist

Chroma: 2 to 4 dry, 3 to 6 moist

Texture of the fine-earth fraction: Loam, clay loam, or silty clay loam

Content of clay: 25 to 35 percent

Rock fragments: 20 to 30 percent gravel, 10 to 40 percent cobbles, and 10 to 25 percent stones

Walnett Series

Setting

Landscape position: Mountain slopes and broad ridges

Parent material: Residuum and colluvium derived from serpentinized peridotite

Slope: 9 to 70 percent

Elevation: 180 to 3,010 feet (55 to 918 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately high to moderately low

Slowest permeability: Moderate to slow

Mean annual precipitation: 90 to 120 inches (2,290 to 3,050 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 100 to 180 days

Taxonomic classification: Loamy-skeletal, parasesquic, mesic Ultic Haploxeralfs

Modal Pedon

Walnett very stony loam, in an area of Jayel-Walnett-Oragran complex, 30 to 75 percent slopes, extremely stony, on a northeast-facing slope of 40 percent, under knobcone pine, huckleberry oak, California laurel, and tanoak with 10 percent stones on the surface, at an elevation of 2,940 feet (896 meters); in Six Rivers National Forest, Del Norte County, California; USGS High Plateau Mountain, California-Oregon quadrangle; SE¹/₄NW¹/₄ sec. 19, T. 18 N., R. 3 E., Humboldt Base Meridian.

Oi—0 to 1 inch (0 to 2 centimeters); fresh and decomposing leaf and needle litter; strongly acid (pH 5.3).

A—1 to 5 inches (2 to 13 centimeters); strong brown (7.5YR 5/6) very stony loam, brown (7.5YR 4/4) moist; moderate fine subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; few very fine, fine, and coarse roots; many very fine interstitial pores; 20 percent gravel and 15 percent stones; moderately acid (pH 5.9); clear smooth boundary.

Bt1—5 to 23 inches (13 to 58 centimeters); strong brown (7.5YR 5/6) very gravelly clay loam, brown (7.5YR 4/4) moist; strong fine subangular blocky structure; hard, friable, sticky and plastic; few very fine, common fine, and few coarse roots; many very fine interstitial pores; common moderately thick clay films on peds and in pores; 35 percent gravel and 5 percent cobbles; slightly acid (pH 6.1); gradual wavy boundary.

Bt2—23 to 43 inches (58 to 109 centimeters); brownish yellow (10YR 6/6) very gravelly clay loam, dark yellowish brown (10YR 4/4) moist; moderate very fine subangular blocky structure; hard, friable, sticky and plastic; few fine roots; common very fine interstitial pores; few moderately thick clay films on peds and in pores; 35 percent gravel and 10 percent cobbles and stones; slightly acid (pH 6.1); gradual smooth boundary.

C—43 to 61 inches (109 to 155 centimeters); yellow (10YR 7/6) very gravelly loam, yellowish brown (10YR 5/6) moist; weak very fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few fine roots; common very fine interstitial pores; 50 percent gravel and 5 percent cobbles and stones; slightly acid (pH 6.2).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 27 to 35 percent clay and 35 to 60 percent rock fragments

Water table: None noted

Surface fragments: 3 to 15 percent stones

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 7.5YR or 10YR

Value: 5 to 7 dry, 4 or 5 moist

Chroma: 3 to 8 dry, 3 to 6 moist

Texture of the fine-earth fraction: Loam

Content of clay: 22 to 28 percent

Rock fragments: 20 to 35 percent gravel and 15 to 20 percent stones

Reaction: Slightly acid or moderately acid

Bt horizon

Hue: 7.5YR or 10YR

Value: 5 to 7 dry, 4 or 5 moist

Chroma: 3 to 8 dry, 4 to 8 moist

Texture of the fine-earth fraction: Clay loam or silty clay loam

Content of clay: 27 to 35 percent

Rock fragments: 20 to 55 percent gravel and 5 to 20 percent cobbles or stones

Reaction: Slightly acid or moderately acid

C horizon

Hue: 7.5YR or 10YR

Value: 5 to 7 dry, 4 or 5 moist

Chroma: 6 to 8 dry or moist

Texture of the fine-earth fraction: Loam, clay loam, or silty clay loam

Content of clay: 25 to 35 percent

Rock fragments: 20 to 50 percent gravel and 5 to 20 percent cobbles or stones

Reaction: Neutral or slightly acid

Weitchpec Series

Setting

Landscape position: Mountain slopes

Parent material: Residuum and colluvium derived from serpentinite (fig. 25)

Slope: 30 to 50 percent

Elevation: 845 to 2,135 feet (259 to 652 meters)

Depth class: Moderately deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately high to moderately low

Slowest permeability: Moderate to slow

Mean annual precipitation: 90 to 120 inches (2,290 to 3,050 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Figure 25.—A profile of a Weitchpec soil. These soils form in colluvium and residuum derived from serpentinite. They are 50 to 100 centimeters deep to bedrock. Depth is marked in centimeters.

Frost-free season: 100 to 150 days

Taxonomic classification: Loamy-skeletal, magnesian, mesic Typic Haploxerepts

Modal Pedon

Weitchpec gravelly silt loam, in an area of Oragan-Weitchpec complex, 30 to 50 percent slopes, on an east-facing slope of 20 percent, at an elevation of 3,650 feet (1,112 meters); in Six Rivers National Forest, Del Norte County, California; USGS Hurdygurdy Butte, California, quadrangle; SW¹/₄SE¹/₄ sec. 25, T. 17 N., R. 3 E., Humboldt Base Meridian.

A—0 to 8 inches (0 to 20 centimeters); pale brown (10YR 6/3) gravelly silt loam, brown (10YR 4/3) moist; weak very fine and fine granular structure; slightly hard, firm, nonsticky and nonplastic; common fine, many medium, and few coarse roots; 25 percent gravel; moderately acid (pH 5.8); gradual wavy boundary.

Bw1—8 to 30 inches (20 to 76 centimeters); very pale brown (10YR 7/4) extremely gravelly sandy loam, yellowish brown (10YR 5/4) moist; moderate very fine subangular blocky structure; slightly hard, firm, nonsticky and nonplastic; common very fine and fine and few medium and coarse roots; 60 percent gravel; moderately acid (pH 5.9); gradual wavy boundary.

Bw2—30 to 35 inches (76 to 89 centimeters); brownish yellow (10YR 6/6) very gravelly sandy loam, yellowish brown (10YR 5/4) moist; weak very fine subangular blocky structure; slightly hard, firm, nonsticky and nonplastic; few fine and medium roots; 35 percent gravel and 10 percent cobbles and stones; moderately acid (pH 5.9).

R—35 inches (89 centimeters); fractured serpentine; fractures 2 to 4 inches (5 to 10 centimeters) apart.

Range in Characteristics

Depth to hard bedrock: 20 to 40 inches (51 to 102 centimeters)

Control section (by weighted average): 18 to 30 percent clay and 35 to 60 percent rock fragments

Water table: None noted

O horizon (where present)

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Texture of the fine-earth fraction: Slightly decomposed organic material

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 10YR

Value: 5 to 7 dry, 3 to 6 moist

Chroma: 3 or 4 dry, 2 or 3 moist

Texture of the fine-earth fraction: Loam, silt loam, or clay loam

Content of clay: 15 to 20 percent

Rock fragments: 15 to 30 percent gravel and 0 to 5 percent cobbles

Reaction: Slightly acid or moderately acid

Bw horizon

Hue: 10YR or 2.5Y

Value: 5 to 8 dry, 4 or 5 moist

Chroma: 4 to 6 dry or moist

Texture of the fine-earth fraction: Sandy loam, clay loam, or sandy clay loam

Content of clay: 15 to 35 percent

Rock fragments: 35 to 60 percent gravel and 0 to 20 percent cobbles or stones

Reaction: Slightly acid or moderately acid

C horizon (where present)

Hue: 10YR

Value: 5 to 7 dry, 4 or 5 moist

Chroma: 2 to 8 dry, 4 to 8 moist

Texture of the fine-earth fraction: Sandy clay loam, loam, or clay loam

Content of clay: 23 to 35 percent

Rock fragments: 35 to 60 percent gravel, 0 to 20 percent cobbles, and 0 to 20 percent stones

Reaction: Slightly acid or moderately acid

Weott Series

Setting

Landscape position: Depressions and backswamps on low flood-plain steps

Parent material: Alluvium derived from mixed sources

Slope: 0 to 2 percent

Elevation: 0 to 65 feet (0 to 20 meters)

Depth class: Very deep

Drainage class: Very poorly drained

Slowest saturated hydraulic conductivity: Moderately low

Slowest permeability: Moderately slow

Flooding: Occasional

Ponding: Frequent

Mean annual precipitation: 35 to 80 inches (890 to 2,030 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 275 to 330 days

Taxonomic classification: Fine-silty, mixed, superactive, nonacid, isomesic
Fluvaqueptic Endoaquepts

Modal Pedon

Weott silt loam, in an area of Weott, 0 to 2 percent slopes, on a slope of 1 percent, under cinquefoil, pasture grasses, curly dock, and rushes, at an elevation of 5 feet (1.5 meters); Humboldt County, California; USGS Ferndale quadrangle; UTM zone 10, 373761mE, 4499845mN, NAD83.

Ap—0 to 12 inches (0 to 31 centimeters); dark grayish brown (2.5Y 4/2) silt loam, light brownish gray (2.5Y 6/2) dry; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine to medium roots; many fine and very fine tubular pores; few fine distinct olive brown (2.5Y 4/4) iron-manganese masses; slightly acid (pH 6.5); clear wavy boundary.

Bg1—12 to 26 inches (31 to 66 centimeters); dark grayish brown (2.5Y 4/2) silt loam, light brownish gray (2.5Y 6/2) dry; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine and fine tubular pores; many fine prominent dark yellowish brown (10YR 4/6) iron-manganese masses; slightly alkaline (pH 7.5); gradual wavy boundary.

Bg2—26 to 60 inches (66 to 152 centimeters); dark grayish brown (2.5Y 4/2) silt loam, light brownish gray (2.5Y 6/2) dry; massive; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine and fine tubular pores; common fine prominent dark yellowish brown (10YR 4/6) iron-manganese masses; few fine prominent dark gray (N 4/0) iron depletions; moderately alkaline (pH 8.0).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 18 to 33 percent clay

Water table: At a depth of 0 to 4 inches (0 to 10 centimeters) from about January through March, 6 to 24 inches (15 and 60 centimeters) in April, 12 to 35 inches (30 to 90 centimeters) May through June, 35 to greater than 72 inches (90 to greater than 182 centimeters) July through November, and 6 to 24 inches (15 and 60 centimeters) in December

A or Ap horizon

Hue: 10YR or 2.5Y

Value: 1 to 6 dry or moist

Chroma: 2 or 3 dry or moist

Texture of the fine-earth fraction: Silt loam

Content of clay: 18 to 27 percent

Reaction: Neutral or slightly acid

Redoximorphic features:

Type—fine and medium masses of iron accumulation

Quantity—few to many

Hue—7.5YR, 10YR, or 2.5Y

Value—4 or 5 moist

Chroma—4 to 6 moist

Upper part of the Bg horizon

Hue: 10YR, 2.5Y, or 5Y

Value: 4 to 6 dry or moist

Chroma: 2 dry or moist

Texture of the fine-earth fraction: Silt loam or silty clay loam

Content of clay: 18 to 33 percent

Reaction: Slightly acid to slightly alkaline

Redoximorphic features:

Type—fine and medium masses of iron accumulation

Quantity—few to many

Hue—10YR or 7.5YR

Value—4 to 6 moist

Chroma—4 to 6 moist

Lower part of the Bg horizon

Hue: 2.5Y or 5Y

Value: 4 to 6 dry or moist

Chroma: Neutral, 1, or 2 dry or moist

Texture of the fine-earth fraction: Fine sandy loam, loam, silt loam, or silty clay loam

Content of clay: 15 to 35 percent

Reaction: Neutral to moderately alkaline

Redoximorphic features:

Type—fine and medium masses of iron accumulation

Quantity—few to many

Hue—7.5YR or 10YR

Value—4 to 6 moist

Chroma—4 to 6 moist

Type—fine and medium masses of iron depletions

Quantity—few to many

Hue—2.5Y, 5Y, or neutral

Value—2.5 to 4 moist

Chroma—neutral or 1 moist

Wiregrass Series

Setting

Landscape position: Mountain slopes and broad ridgetops

Parent material: Colluvium and residuum from schist, sandstone, and mudstone

Slope: 0 to 75 percent

Elevation: 155 to 3,185 feet (48 to 972 meters)

Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately low to moderately high

Slowest permeability: Slow or moderately slow

Mean annual precipitation: 75 to 100 inches (1,900 to 2,550 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 220 to 290 days

Taxonomic classification: Fine-loamy, mixed, semiactive, isomesic Ustic Palehumults

Modal Pedon

Wiregrass very gravelly silt loam, in an area of Wiregrass-Rockysaddle complex, 30 to 50 percent slopes, on a uniform, northwest-facing slope of 39 percent, under tanoak, redwood, Douglas-fir, Pacific madrone, and California huckleberry, at an elevation of 940 feet (287 meters); in Redwood National Park, Humboldt County, California; USGS Bald Hills quadrangle; UTM zone 10, 421413mE, 4557610mN, NAD83.

- Oi—0 to 1 inch (0 to 3 centimeters); slightly decomposed needles, leaves, and twigs; abrupt smooth boundary.
- A—1 to 5 inches (3 to 12 centimeters); dark yellowish brown (10YR 3/4) very gravelly silt loam, pale brown (10YR 6/3) dry; weak fine granular and subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine, fine, and medium roots; common very fine irregular and common very fine and fine tubular pores; 36 percent gravel; strongly acid (pH 5.3); clear smooth boundary.
- AB—5 to 11 inches (12 to 29 centimeters); dark yellowish brown (10YR 3/4) gravelly silty clay loam, light yellowish brown (10YR 6/4) dry; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine, fine, medium, and coarse roots; common very fine and fine tubular pores; 20 percent gravel and 5 percent cobbles; very strongly acid (pH 5.0); gradual smooth boundary.
- BAt—11 to 17 inches (29 to 44 centimeters); dark yellowish brown (10YR 4/4) gravelly silty clay loam, very pale brown (10YR 7/4) dry; weak fine and medium subangular blocky structure; slightly hard, very friable, moderately sticky and slightly plastic; few very fine and fine and common medium and coarse roots; common very fine and fine tubular pores; 14 percent gravel and 10 percent cobbles; very strongly acid (pH 5.0); gradual wavy boundary.
- Bt1—17 to 31 inches (44 to 78 centimeters); yellowish brown (10YR 5/4) very gravelly clay loam, pale yellow (2.5Y 7/3) dry; weak medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; few very fine, fine, medium, and coarse roots; few very fine and fine tubular pores; 38 percent gravel and 5 percent cobbles; strongly acid (pH 5.2); gradual wavy boundary.
- Bt2—31 to 41 inches (78 to 103 centimeters); light olive brown (2.5Y 5/4) very gravelly clay loam, pale yellow (2.5Y 8/2) dry; weak coarse subangular blocky structure; slightly hard, firm, moderately sticky and moderately plastic; few very fine, fine, medium, and coarse roots; few very fine and fine tubular pores; few faint clay films on faces of peds; 38 percent gravel and 5 percent cobbles; very strongly acid (pH 4.8); gradual smooth boundary.

Bt3—41 to 67 inches (103 to 170 centimeters); light olive brown (2.5Y 5/4) very gravelly clay loam, light gray (2.5Y 7/2) dry; weak coarse subangular blocky structure; slightly hard, firm, moderately sticky and moderately plastic; few very fine, fine, medium, and coarse roots; few very fine tubular pores; common faint clay films on faces of peds; 43 percent gravel and 5 percent cobbles; strongly acid (pH 5.3).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 27 to 35 percent clay, 0 to 35 percent gravel, and 0 to 15 percent cobbles

Water table: None noted

Reaction: Slightly acid to very strongly acid

Surface fragments: 0 to 75 percent gravel

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 7.5YR or 10YR

Value: 4 to 7 dry, 3 or 4 moist

Chroma: 2 to 4 dry or moist

Texture of the fine-earth fraction: Silt loam or loam

Content of clay: 20 to 30 percent

Rock fragments: 0 to 45 percent gravel and 0 to 5 percent cobbles

Bt horizon

Hue: 7.5YR, 10YR, or 2.5Y

Value: 4 to 8 dry, 2 to 6 moist

Chroma: 2 to 6 dry, 3 to 8 moist

Texture of the fine-earth fraction: Loam, silty clay loam, or clay loam

Content of clay: 25 to 40 percent

Rock fragments: 0 to 45 percent gravel and 0 to 15 percent cobbles

C horizon (where present)

Hue: 10YR, 2.5Y, or 5Y

Value: 6 to 8 dry, 4 to 6 moist

Chroma: 2 to 4 dry, 2 to 8 moist

Texture of the fine-earth fraction: Loam or clay loam

Content of clay: 20 to 40 percent

Rock fragments: 0 to 50 percent gravel, 0 to 15 percent cobbles, and 0 to 10 percent stones

Worswick Series

Setting

Landscape position: Backswamps and low flood-plain steps

Parent material: Alluvium derived from mixed sources

Slope: 0 to 2 percent

Elevation: 0 to 160 feet (0 to 50 meters)

Depth class: Very deep

Drainage class: Very poorly drained

Slowest saturated hydraulic conductivity: Moderately high

Slowest permeability: Moderately slow

Flooding: Occasional

Ponding: Occasional

Mean annual precipitation: 35 to 80 inches (890 to 2,030 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 275 to 330 days

Taxonomic classification: Coarse-silty, mixed, superactive, nonacid, isomesic
Fluvaqueptic Endoaquepts

Modal Pedon

Worswick loam, in an area of Worswick, 0 to 2 percent slopes, on a slope of 1 percent, under pasture grasses and clover with scattered curly dock, at an elevation of 16 feet (5 meters); Humboldt County, California; USGS Ferndale quadrangle (7.5 minutes series); UTM zone 10, 391489mE, 4493864mN, NAD83.

Ap—0 to 9 inches (0 to 23 centimeters); dark grayish brown (2.5Y 4/2) loam, light brownish gray (2.5Y 6/2) dry; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few medium and common very fine and fine roots; few very fine tubular pores; common fine prominent dark yellowish brown (10YR 4/4) masses of iron accumulation and common fine faint dark gray (2.5Y 4/1) iron depletions in the matrix; slightly acid (pH 6.5); gradual wavy boundary.

Bg1—9 to 30 inches (23 to 76 centimeters); dark grayish brown (2.5Y 4/2) fine sandy loam, light brownish gray (2.5Y 6/2) dry; massive; slightly hard, friable, slightly sticky and slightly plastic; few fine and common very fine roots; few very fine tubular pores; common medium prominent dark yellowish brown (10YR 4/4) masses of iron accumulation and common medium faint dark gray (2.5Y 4/1) iron depletions in the matrix; slightly acid (pH 6.5); gradual wavy boundary.

Bg2—30 to 60 inches (76 to 152 centimeters); dark grayish brown (2.5Y 4/2) loam, light brownish gray (2.5Y 6/2) dry; massive; slightly hard, friable, slightly sticky and slightly plastic; few very fine roots; few very fine tubular pores; common medium prominent dark yellowish brown (10YR 4/6) masses of iron accumulation and many coarse faint dark gray (2.5Y 4/1) iron depletions in the matrix; neutral (pH 7.0).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 10 to 18 percent clay

Water table: At a depth of 0 to 4 inches (0 to 10 centimeters) from about January through March, 4 to 24 inches (10 to 60 centimeters) in April, 12 to 35 inches (30 and 90 centimeters) May through June, 35 to greater than 72 inches (90 to greater than 182 centimeters) July through November, and 6 to 24 inches (15 and 60 centimeters) in December

A or Ap horizon

Hue: 10YR or 2.5Y

Value: 5 or 6 dry, 3 or 4 moist

Chroma: 1 or 2 dry or moist

Texture of the fine-earth fraction: Loam or silt loam

Content of clay: 15 to 25 percent

Reaction: Slightly acid or neutral

Redoximorphic features:

Type—fine and medium iron-manganese masses in the matrix; iron stains lining root channels and/or pores

Quantity—few to many
Hue—7.5YR, 10YR, or 2.5Y
Value—3 to 5 moist
Chroma—4 to 6 moist

Upper part of the Bg horizon

Hue: 10YR, 2.5Y, or 5Y
Value: 5 or 6 dry, 3 to 5 moist
Chroma: 1 or 2 dry or moist
Texture of the fine-earth fraction: Very fine sandy loam, fine sandy loam, or loam
Content of clay: 10 to 18 percent
Reaction: Slightly acid to slightly alkaline
Redoximorphic features:

Type—medium and coarse iron-manganese masses in the matrix; iron stains lining root channels and/or pores

Quantity—common or many
Hue—7.5YR, 10YR, or 2.5Y
Value—3 to 5 moist
Chroma—3 to 6 moist

Type—medium and coarse iron depletions in the matrix

Quantity—few to many
Hue—2.5Y, 5Y, or neutral
Value—2.5 to 6 moist
Chroma—neutral to 2 moist

Lower part of the Bg horizon

Hue: 10YR, 2.5Y, or 5Y
Value: 5 to 6 dry, 3 to 5 moist
Chroma: 1 or 2 dry or moist
Texture of the fine-earth fraction: Loamy sand, very fine sandy loam, fine sandy loam, loam, silt loam, or silty clay loam
Content of clay: 5 to 30 percent
Rock fragments: 0 to 25 percent gravel
Reaction: Slightly acid to slightly alkaline
Redoximorphic features:

Yeti Series

Setting

Landscape position: Broad ridges and upper hillslopes and mountain slopes
Parent material: Colluvium and residuum derived from sandstone and mudstone
Slope: 5 to 30 percent
Elevation: 5 to 1,295 feet (3 to 395 meters)
Depth class: Very deep

Drainage class: Well drained

Slowest saturated hydraulic conductivity: Moderately low

Slowest permeability: Slow

Mean annual precipitation: 65 to 90 inches (1,650 to 2,290 millimeters)

Mean annual temperature: 50 to 55 degrees F (10 to 13 degrees C)

Frost-free season: 250 to 300 days

Taxonomic classification: Fine, mixed, superactive, isomesic Typic Palehumults

Modal Pedon

Yeti clay loam, in an area of Sasquatch-Yeti-Sisterrocks complex, 15 to 30 percent slopes, on a linear, southwest-facing slope of 15 percent, under Sitka spruce, red alder, salmonberry, and swordfern, at an elevation of 90 feet (27 meters); in Redwood National Park, Del Norte County, California; USGS Requa quadrangle; UTM zone 10, 408251mE, 4605028mN, NAD83.

Oi—0 to 1 inch (0 to 3 centimeters); black (10YR 2/1) slightly decomposed plant material, dark brown (10YR 3/3) dry; 95 percent fiber unrubbed, 80 percent rubbed; fiber identifiable as fresh and decomposing salmonberry and alder leaves, Sitka spruce needles and twigs, and swordfern fronds; very strongly acid (pH 4.8); clear smooth boundary.

A—1 to 11 inches (3 to 27 centimeters); very dark brown (10YR 2/2) clay loam, dark grayish brown (10YR 4/2) dry; moderate very fine and fine subangular blocky structure; moderately hard, firm, slightly sticky and moderately plastic; common very fine, fine, medium, and coarse roots; common very fine and fine tubular and many very fine and fine irregular pores; 10 percent gravel; very strongly acid (pH 4.8); clear smooth boundary.

AB—11 to 16 inches (27 to 40 centimeters); very dark brown (10YR 2/2) clay loam, brown (10YR 4/3) dry; moderate very fine and fine subangular blocky structure; slightly hard, friable, slightly sticky and moderately plastic; common very fine, fine, and medium roots; common very fine, fine, medium, and very coarse tubular and common very fine and fine irregular pores; 5 percent gravel; very strongly acid (pH 4.8); clear wavy boundary.

Bt1—16 to 23 inches (40 to 59 centimeters); dark yellowish brown (10YR 4/4) clay loam, light yellowish brown (10YR 6/4) dry; moderate fine and medium subangular blocky structure; hard, firm, moderately sticky and very plastic; few distinct clay films on faces of peds; common fine, medium, and coarse roots; common very fine, fine, medium, and very coarse tubular and common very fine and fine irregular pores; 10 percent gravel; very strongly acid (pH 4.7); clear wavy boundary.

Bt2—23 to 32 inches (59 to 82 centimeters); yellowish brown (10YR 5/6) clay loam, brownish yellow (10YR 6/6) dry; moderate fine and medium subangular blocky structure; moderately hard, firm, very sticky and very plastic; few distinct clay films on faces of peds; moderately few fine and common medium roots; common very fine, fine, and very coarse tubular and common very fine and fine irregular pores; 3 percent gravel and 5 percent paragravel; very strongly acid (pH 4.5); clear smooth boundary.

Bt3—32 to 43 inches (82 to 109 centimeters); yellowish brown (10YR 5/6) clay loam, yellow (10YR 7/6) dry; weak fine and medium subangular blocky structure; moderately hard, firm, very sticky and very plastic; few distinct clay films on faces of peds and rock fragments; moderately few fine and common medium roots; common very fine, fine, and very coarse tubular and moderately few very fine and fine irregular pores; 5 percent gravel, 5 percent paragravel, and 2 percent paracobbles; very strongly acid (pH 4.5); gradual smooth boundary.

Bt4—43 to 52 inches (109 to 132 centimeters); yellowish brown (10YR 5/6) paragravelly clay loam, yellow (10YR 7/6) dry; weak medium subangular blocky

Soil Survey of Redwood National and State Parks, California

structure; moderately hard, firm, moderately sticky and moderately plastic; common clay films of rock fragments and few distinct clay films on faces of peds; very few fine roots; moderately few very fine and fine irregular pores; 5 percent gravel, 10 percent paragravel, and 2 percent paracobbles; very strongly acid (pH 4.5); clear wavy boundary.

Bt5—52 to 67 inches (132 to 170 centimeters); yellowish brown (10YR 5/6) paragravelly clay loam, yellow (10YR 7/6) dry; weak medium subangular blocky structure; moderately hard, firm, moderately sticky and moderately plastic; few distinct clay films on faces of peds and on rock fragments; very few fine roots; very few very fine and fine irregular pores; 10 percent gravel, 20 percent paragravel, and 7 percent paracobbles; very strongly acid (pH 4.5).

Range in Characteristics

Bedrock: None observed

Control section (by weighted average): 35 to 50 percent clay, 0 to 13 percent gravel, and 0 to 7 percent paragravel

Water table: None noted

Reaction: Strongly acid or very strongly acid

O horizon

Hue: 10YR

Value: 2 to 6 dry or moist

Chroma: 1 to 4 dry or moist

Kind of organic material: Slightly decomposed

Wood fragments: 0 to 35 percent

Reaction: Moderately acid to very strongly acid

A horizon

Hue: 7.5YR or 10YR

Value: 4 or 5 dry, 2 or 3 moist

Chroma: 2 to 4 dry or moist

Texture of the fine-earth fraction: Loam or clay loam

Content of clay: 25 to 33 percent

Rock fragments: 0 to 13 percent gravel

Upper part of the Bt horizon

Hue: 7.5YR, 10YR, or 2.5Y

Value: 5 to 7 dry, 3 to 5 moist

Chroma: 3 to 6 dry or moist

Texture of the fine-earth fraction: Clay loam or clay

Content of clay: 35 to 50 percent

Rock fragments: 0 to 13 percent gravel

Pararock fragments: 0 to 7 percent paragravel

Lower part of the Bt horizon

Hue: 7.5YR, 10YR, or 2.5Y

Value: 5 to 7 dry, 3 to 5 moist

Chroma: 3 to 6 dry or moist

Texture of the fine-earth fraction: Clay loam or clay

Content of clay: 30 to 50 percent

Rock fragments: 0 to 30 percent gravel

Pararock fragments: 0 to 20 percent paragravel and 0 to 7 percent paracobble

C horizon (where present)

Hue: 7.5YR, 10YR, or 2.5Y

Value: 6 or 7 dry, 4 to 6 moist

Chroma: 4 to 6 dry or moist

Soil Survey of Redwood National and State Parks, California

Texture of the fine-earth fraction: Clay loam or clay

Content of clay: 35 to 50 percent

Rock fragments: 0 to 30 percent gravel

Pararock fragments: 0 to 25 percent paragravel

Formation of the Soils

Soils are classified, mapped, and interpreted on the basis of variations in the kinds and arrangement of soil horizons. The degree and expression of the horizons are a reflection of the extent of the interaction between soil-forming factors and soil forming processes. The factors include climate, time, relief, parent material, and living organisms. The processes include additions, removals, transfers, and transformations.

Important diagnostic surface horizons in this survey area include ochric and umbric epipedons. Significant diagnostic subsurface horizons include cambic and argillic horizons. These diagnostic horizons are defined in the Glossary.

To the soil mapper, a rationale describing the formation and behavior of the soils helps account for soil patterns and facilitates the mapping process. Such a rationale can be used as a basis for predicting soil behavior and the effects of land management. For the soil survey user, the rationale can make it easier to understand, use, and critique the soil survey and to apply the survey more intelligently in situations requiring judgement.

Soil mappers cannot completely understand the formation of the soils in an area, even if the mapper has worked in the area for years. Soils are mapped primarily by observation and hypothesis testing. Inferences are drawn, whenever possible, about repeating patterns on the landscape. Commonly, more than one hypothesis can account for a particular pattern.

McLaughlin and Harradine (1965) state "Soil is the product of the action of climate and living organisms upon the parent material, as conditioned by time and relief. The interrelationships among the factors of soil formation are complex, and the effect of any one factor cannot be isolated and identified with certainty."

Geologically speaking, northwestern California has been a region of tectonic uplift for at least 2 million years (Kelsey and Cashman, 1983). Regionally, the effect of uplift has been to rejuvenate the landscape, building mountains and exposing fresh geologic parent materials to surficial processes, including processes of soil formation. A near-surface environment is unfavorable to persistence of freshly exposed geologic materials in three important respects.

First, gravity, running water, wind, and organisms break down and transport near-surface earth materials, continually acting upon exposed geologic materials.

Second, geologic materials are released from confining pressure as they near the earth's surface; rock minerals cease to be thermodynamically stable. Temperatures near the surface are not constant, but vary with seasons, diurnally, and due to shadow effects, freezing, thawing, and fire. Most rocks slowly disintegrate due to the temperature fluctuations and the gradual loss of strength in the absence of confining pressure. This disintegration is termed physical weathering.

Third, the near-surface environment is chemically inimical to most rocks. It is primarily an oxidizing, rather than a reducing, environment. It is also a leaching environment where there is an abundance of fresh, moving water capable of removing soluble constituents. Leaching is enhanced by soil organisms, which produce carbon dioxide (an acidifier) and organic compounds, some of which are acids or chelates. Some organisms actively break down and exploit minerals for the elements the organisms need to grow. Over time, rock minerals break down and soil minerals

form. This dissolution and transformation constitutes chemical weathering. Rates of chemical weathering processes vary. Some processes require thousands of years to complete.

All weathering involves processes that break down parent material. The presence of living organisms promotes weathering, but plants and animals are also responsible for processes that conserve or increase certain elements in soils relative to the geologic parent material. Calcium and potassium ions are essential to plants. The ions are actively accumulated and cycled by plants. Green plants accumulate carbon during photosynthesis, and some plants have associations with nitrogen-fixing microbes. Plants and animals contribute organic matter to soil. The organic matter increases the content of elemental carbon and nitrogen in the soil and greatly affects soil properties. Together, all of the chemical processes, abiotic and biotic, are "pedogenic," or soil forming.

The most important process in chemical weathering is hydrolysis. Birkland (1984) presents chemical equations depicting the hydrolysis of orthoclase feldspar into clays, aqueous silicate, and potassium ions. The clays are weathering products, whereas the silicate and potassium ions may be leached or taken up by vegetation. Another important process in chemical weathering is oxidation. In an oxidizing environment, the ferrous (divalent) iron in rock minerals is oxidized to insoluble hydrated ferric (trivalent) oxides. These hydrated iron oxides persist and are responsible for yellowish and reddish colors in soils. Because physical disintegration, hydrolysis, leaching, and oxidation occur concurrently, the proportion of material that consists of rock fragments and weatherable minerals becomes smaller as a soil forms and the proportion that consists of clay and iron oxides becomes larger. The proportions of rock fragments and clay are easily assessed in the field, and relative amounts of iron oxide are also easily judged from the intensity of yellow to red colors. Taken together, these soil characteristics provide a rough index of the relative age or development of a soil.

Soils do not have uniform depth or position on the landscape. They develop three-dimensionally. Each soil has a vertical profile consisting of several layers, termed horizons, that are roughly parallel to the surface of the ground. The major horizons of mineral soils are the A horizon, B horizon, and C horizon. The A horizon is at the surface and is distinguished primarily by an accumulation of organic matter. The B horizon is distinguished by a maximal degree of weathering and alteration of the parent material by soil forming processes. The C horizon may be weathered but otherwise lacks alteration by soil forming processes.

The buildup of organic matter in the A horizon is due to the concentration of biological activity, especially that of plant roots, in the upper part of the soil. Organic matter generally makes soil darker in color than its mineral constituents would be alone. Organic matter increases the soil's capacity to store water and plant-essential elements, and it tends to bind individual mineral particles into larger, natural aggregates, called peds. The A horizon tends to have many stable, granular peds with considerable pore space between them. Because of the low specific gravity of organic matter and the abundant pore space, the A horizon tends to be light and fluffy compared to deeper horizons. Its porosity facilitates passage of water and gases, as reflected in gross physical measurements of permeability or saturated hydraulic conductivity.

In any profile, the B horizon is generally the horizon that is most leached and has the lowest content of rock fragments, the highest content of clay, and the brightest, reddest colors. It also tends to have the largest peds. Peds in the B horizon tend to be subangular blocks that fit together rather closely. The B horizon, therefore, has considerably less pore space than the A horizon. Leaching, weathering, loss of rock fragments, accumulation of clay, brighter and redder colors, and large peds are all products and signs of soil formation. These products of soil formation might be expected to be more prevalent in the A horizon than the B horizon because the soil-

forming processes are more active in the A horizon and have operated longer. The A horizon, however, has unique processes that tend to disrupt the accumulation of these products. These processes include intense biological activity, wetting and drying, and other events in the immediate vicinity of the ground surface.

One process that is particularly active in the A horizon is eluviation (removal) of clay. At the surface, cycles of wetting and drying, movements of animals, and uprooting of plants by animals and wind often disrupt peds and the detached rocks that are carried by gravity. When rain occurs, clay from broken peds is carried in suspension and translocated downward. Some of this clay is re-deposited in pores and on surfaces of peds in the B horizon. Clay eluviation accounts in large part for most A horizons having less clay than underlying B horizons. B horizons that have films of clay lining pores and peds are labeled Bt horizons. Most of the B horizons in the survey area are Bt horizons.

Jenny (1941) and McLaughlin and Harradine (1965) identify five factors of soil formation: climate, time, relief, parent material, and living organisms. People can be considered as an additional factor. In places, cultural practices have played a significant role in shaping patterns of soils. Variations in the factors influence the relative intensity of soil forming processes and therefore the distribution of soils regionally and at finer scales. Because the interrelationships among the factors of soil formation are complex, it is usually most productive to consider them one or two at a time.

Climate

Climate exerts an influence on soil formation at regional, local, and micro scales. Regionally, cool, wet winters and nearly rainless summers characterize the climate of northwestern California. Locally, summer conditions range from mild with fog drip on ocean-facing slopes to warm and dry farther inland. Throughout the region, the climate supplies excess water to the soil in the winter and partially or entirely removes water in the summer. The supply and demand for soil water is almost exactly out of phase (Major, 1988). Because of the excess winter precipitation, the soils tend to be strongly leached. The consequences of intense leaching include low base saturation and the presence of kaolinitic clay, iron oxides, and aluminum oxides as the products of long-term weathering. Base saturation in the B horizon of the well drained soils is typically about 10 to 35 percent.

Locally within the survey area, soil patterns are attributable either to gradients in precipitation and air temperature or to differences in vegetation, which, in turn, are attributable to influences of climate. There are some distinctive effects of the maritime climate. The level of exchangeable sodium in well drained, forested soils on ocean-facing slopes is about twice that of well drained, forested soils that formed in similar parent material farther inland. The elevated content of sodium can be attributed directly to salt-laden aerosols derived from ocean spray.

Time

Soils take time to form. Birkland (1984) estimates that A horizons are fully formed within a thousand years, but that the subsurface reddening and in-place clay formation in B horizons typically requires thousands or tens of thousands of years. Given these time frames, soils can be useful in approximating the ages of geomorphic surfaces. An example of an area with a very young surface would be map unit 100, Riverwash, which follows the channel of Redwood Creek. The particles that comprise the streambed vary in size from silt to boulders and are little weathered. The surface is flooded and reworked every time there is a storm. There is not enough time for the development of an A horizon, let alone a Bt horizon.

An example of an area with a slightly older surface is map unit 172, Bigriver, 2 to 5 percent slopes. This unit is on alluvial flats, including the Tall Trees Grove. The

particles that comprise this soil are silt- to sand-sized and are deposited by overbank flooding. Flooding every few years just barely tops the alluvial flats and does not add much sediment. Large floods every hundred years or so, however, build new surfaces. Within a century, an A horizon has begun to form in the new surface. In any given profile of the soil, buried A horizons of varying ages exist. The buried A horizons are slightly darker and browner than the surrounding layers and tend to have many roots and incipient soil structure. In general, Bigriver soils are in depositional areas where sediments tend to accumulate over time.

Considered above are soils or soil horizons whose ages might be dated to a specific time when water most recently deposited fresh sediment. Elsewhere, for example in the mountains, soils form in regolith weathered from rock. In such areas, the age of the soil is much harder to define. The weathering is a continuous process. The regolith is continually displaced downslope in response to gravity. There is no single age of sediment at any given place to define the age of the soil.

Despite the complications, Zinke and Colwell (1965) describe a broad, general pattern of soils in the mountains. The main variable is the degree of development of the B horizon. Soils that are at least a thousand years old have fully developed A horizons, which have more-or-less reached a steady state. A transect across a mountain landscape underlain by one rock type commonly shows variations in properties that can be arranged in a sequence of degree of development. Soils on very steep, lower slopes (for example, Panthercreek soils), have a B horizon that is thin and weakly developed. The increase in content of clay compared to the A horizon is slight, the hue is yellowish brown (10YR), and the texture is loamy and includes a high content of rock fragments. On less steep, middle slopes, the B horizon is thicker and exhibits greater development. The increase in content of clay compared to the A horizon is moderate, the hue is slightly redder (for example, 7.5YR in Coppercreek soils), and the texture is clayier and has a lower content of rock fragments. This trend continues upslope until, on broad ridgetops, the soils have very thick, strongly developed B horizons (for example, the Trailhead soils). The increase in content of clay compared to the A horizon is great, the hue is red (5YR or 2.5YR), and the texture is clay with few rock fragments. The most developed soils are commonly on plateau-like ridgetops and always on apparently old surfaces.

Marron (1985) studied colluvium in bedrock hollows along the C-10 Road. Although the colluvium in the hollows varied widely in texture and degree of weathering, most deposits tended to be intermediate in the range. Contrasting layers within the deposits were interpreted to reflect either episodic partial evacuation or episodic infilling of material from varying positions on upslope surfaces. Radiocarbon ages of charcoal in one hollow ranged from 9,600 to 9,900 years in the deepest layer and were 7,280 years in the layer above it. The present surface expression of most bedrock hollows is subtle, and upper soil horizons tend to blend with the horizons of the shallower soils around the hollows. This suggests gradual transport of upper layers into the hollows by creep. Whether delivered episodically or continuously by creep, most of the colluvium in hollows is similar in development to the soils directly upslope. This similarity is because much of the colluvium that refills hollows is already preweathered to the state of the surroundings. Thus, in the mountains, geomorphic surfaces can be much younger than the degree of soil development may suggest.

Relief

In the mountains, rates of weathering and geomorphic processes vary and may or may not be in balance at any given point in space or time. In an active landscape, such as the forested lower Redwood Creek basin, relief has a particularly relevant influence on rates of geomorphic processes. The shape and steepness of landforms are the principal factors influencing geomorphic process thresholds and rates. The major processes of mass movement in the mountains include creep, block sliding, and debris

flows. The colluvium transported over mountains by mass movement is eventually carried to streams. Transport by surface water is ultimately the most active erosional process.

Marron and Popenoe (1986) attributed major soil patterns in the Bond Creek subbasin to the interaction of erosional and soil-forming processes, with rates of erosional processes generally being the more variable over the landscape. They argued that, as a consequence of the locations at which erosional processes are most active, soil development generally increases from steeper to gentler slopes and from high- to low-order stream valleys.

Marron and Popenoe (1986) observed greater soil development on north-facing than south-facing slopes in the Bond Creek subbasin. Birkland (1984) cites studies that conclude soils form more rapidly on north-facing than south-facing aspects. Marron and Popenoe (1986) used geomorphic evidence to weigh this hypothesis against the alternative that south-facing slopes mainly experience more active soil stripping. The contrast in soil development coincided with a contrast in slope forms. South-facing slopes exhibited slope forms reflective of fluvial erosion and rapid, shallow landsliding, which are processes that remove soil and expose less-weathered parent material. North-facing slopes exhibited dominance of creep and deep-seated block sliding, which are less vigorous processes that may operate concurrently with soil formation.

Soils in the mountains include material in a range of weathering states. Even in highly developed Bt horizons in Trailhead soils, there are some fresh angular schist fragments in what is otherwise red clay. Colluvium may be preweathered or weather as it moves down a slope but, in moving, it may gain some fresh material. Over thousands of years, trees fall and pull up rock fragments, and mass movements pluck off the weakened edges of protruding bedrock. These fragments become mixed into and rejuvenate the more weathered soil mass. Thus, the B horizons of soils on active mountain slopes in the survey area seem to reflect an average age of the colluvium determined by rates of weathering and soil movement.

The boundaries between soils can be gradual or abrupt. Abrupt soil boundaries tend to coincide with abrupt topographic and process boundaries. For example, in the upper parts of the Devil's Creek and Bridge Creek subbasins, red, clayey Trailhead soils (map unit 561) typify broad divides. Yellowish-brown, loamy Coppercreek soils (map unit 536) are below sharp slope breaks on steep slopes surrounding small drainages. In the Fortyfour Creek subbasin, the transition is commonly more gradual, both in terms of relief and soils, with an intermediate Tectah soil on the intermediate slope gradient. The coincidence of abrupt soil and topographic boundaries is probably a reflection of incidents of fluvial downcutting and mass movement that stripped away soil and exposed less-weathered surfaces. The gradual boundaries are more likely a reflection of changing rates of continuous, concurrent weathering and soil movement.

Parent material

Birkland (1984) identifies texture, elemental composition, and mineral stability as properties that influence soil formation. In the lower Redwood Creek basin, variations in these properties influence soil formation at several scales. At the mapping scale, the soil survey depicts separate soil map units in areas of Franciscan sedimentary and Redwood Creek schist, although the variations among rocks within these geologic units is probably of at least equal importance to soil formation and geomorphic activity. Contrasting sedimentary rocks are mapped separately as the coherent sandstone unit of Lacks Creek (KJFI) and the incoherent mudstone unit of Coyote Creek (KJFc) (Harden and others, 1982). The Redwood Creek schist also varies in mineralogy, texture, lithology, and structure. It consists of metamorphosed mudstone, sandstone, and volcanic rocks.

In the survey area, Devils creek and Panther creek soils in wet, unstable areas within the Redwood Creek schist and Atwell soils in wet, unstable areas within the Franciscan sedimentary stand out clearly and appear associated with the parent material. Each of these soils tends to be in areas with fine-textured, incoherent, apparently sheared rocks. The Atwell soils formed from mudstone and shale. The type of schist in which the Devils creek and Panther creek soils form bears a close resemblance to shale and is probably metamorphosed from shale. On adjacent slopes underlain by relatively competent and coarse textured rocks, there are yellowish brown, well drained, moderately developed soils, whether the rocks are unmetamorphosed sandstone or schist.

In spite of the parallels, there is a striking contrast in properties between the schist and sedimentary members of weakly developed soils in wet areas. Atwell soils, which formed from mudstone and shale, have 30 to 40 percent clay in the C horizon. By contrast, the Devils creek and Panther creek soils, which formed from schist, have 10 to 20 percent clay in the C horizon. Perhaps, when released from confining pressure, the unmetamorphosed mudstone and shale break down physically into their silt and clay constituents; whereas the schist, being more altered, requires chemical weathering to form clay.

Soils of moderate development (for example, Ahpah, Copper creek, Lacks creek, and Slide creek soils) are quite similar in terms of behavior, clay content, and position on the landscape in sedimentary and schist areas. Although there is considerable overlap, the soils that formed from schist seem to average a bit more dithionate-extractable iron than their equivalents that formed from sedimentary rocks and consequently have a bit brighter chromas and redder hues.

Two soils that have strongly developed Bt horizons, Tectah and Trailhead soils, are at slightly lower elevations and on slightly steeper slopes on schist than in sedimentary areas. If the degree of development is a reflection of a balance between erosional and soil-forming processes and if relief primarily determines rates of erosional processes, then the soil-forming processes, which produce Bt horizons, may be more active on schist than on sedimentary rocks. A possible reason is that, due to its greater metamorphism, the schist is more labile in a near-surface environment (Janda 1979). This reason may also help explain why soils with moderate amounts of clay are redder on schist. Starting from schist regolith, which initially has a low content of clay, more chemical weathering is required to reach a moderate content of clay than is required of sedimentary regolith, which initially has a higher content of clay. The amount of chemical weathering largely determines the amount of free iron oxides and consequent increases in chroma and redness.

Parent materials vary at local scales and within profiles. Copper creek, Devils creek, and Panther creek soils adjoin on the landscape. Copper creek soils tend to be higher on the landscape than the Devils creek and Panther creek soils, which are down in hillslope hollows. Typically, the Devils creek soils are around the sides and upper margins of the hollows and the Panther creek soils are in the lower parts and along the axis of the hollows. The Copper creek soils have a B horizon with hue of 10YR or 7.5YR and 25 to 35 percent clay overlying weathered bedrock or a C horizon with 20 to 25 percent clay. The Devils creek soils have a B horizon that is slightly less developed than that of the Copper creek soil and that is abruptly juxtaposed over a gray, 2C horizon of unweathered, sheared rock. The 2C horizon contains only about 10 to 20 percent clay. The Panther creek soils have a very weak, grayish B horizon that has 10 to 20 percent clay overlying a gray C horizon similar to the 2C horizon in the Devils creek soil. There is a difference in parent material between the B and 2C horizons in the Devils creek soil. The A and B horizons in the Devils creek soil appear preweathered and are thought to have been delivered by mass movement from the Copper creek soil directly upslope. The 2C horizon is apparently derived locally from relatively unweathered, sheared schist beneath the hollow. The axis and lower parts

of the hollow typically do not have big, old-growth trees. An absence of large trees is a sign that a hollow has experienced a debris flow in the past few hundred years. Based upon many such observations, it appears in general that regolith is stripped more frequently and vigorously from the lower positions of such hollows than from the upper margins. The lower positions are also farther from a source of preweathered colluvium. Therefore, most if not all of the material in the Panthercreek soils probably derives from the sheared schist beneath the hollow.

Living Organisms

Because it is at the ground surface, the A horizon is the part of the soil most strongly influenced by vegetation. There are definitive visual and chemical differences between the A horizons of soils beneath respective vegetation types in the lower Redwood Creek watershed (Popenoe and others, 1992).

Commonly, climate determines vegetation, and vegetation determines the type of A horizon. Footstep, Ladybird, Sasquatch, Sisterrocks, and Stonehill soils are the dominant forest soils on ocean-facing slopes. Ahpah, Coppercreek, Lacks creek, and Slidecreek soils, which are also forest soils, are in similar topographic positions farther inland. The Footstep, Ladybird, Sasquatch, Sisterrocks, and Stonehill soils have thick, dark A horizons, which, in terms of color and organic carbon content, easily meet the technical requirements for an umbric epipedon. In contrast, the Ahpah, Coppercreek, Lacks creek, and Slidecreek soils have thinner, lighter-colored A horizons, which do not meet the color requirement for an umbric epipedon. On the landscape, the pattern of A horizons is closely correlated with the pattern of understory vegetation. Forests on Ladybird, Sasquatch, Sisterrocks, and Stonehill soils tend to have a dense herbaceous understory dominated by swordfern. By contrast, forests on Lacks creek, Coppercreek, Ahpah, and Slidecreek soils tend to have understories dominated by shrubs with a sparse herb layer. Dense, herbaceous, fern-dominated understories occur both on ocean-facing slopes and on wet, lower, inland slopes. This type of understory apparently develops in response to perennial soil moisture, whether due to fog drip or a shallow water table.

A parallel situation involving soils and vegetation occurs inland. The prairies and oak woodlands in Bald Hills have very lush herbaceous vegetation. Airstrip, Countshill, Dolason, Doolyville, Elkcamp, Maneze, and Pasturerock soils in the prairies and oak woodlands have thick, dark A horizons, which, in terms of color and organic carbon content, easily meet the technical requirements for an umbric or mollic epipedon. In contrast, soils in nearby conifer forests with a shrub understory have thinner, lighter-colored A horizons, which do not meet the technical requirements for an umbric or mollic epipedon.

Soils under prairie vegetation have thicker A horizons than soils under other vegetation types in the park. Examples of soils under prairie vegetation are Airstrip, Countshill, Dolason, and Elkcamp soils. The content of organic carbon and nitrogen is greater in all horizons under prairie vegetation than under other vegetation types, and the content of soil carbon and nitrogen decreases more gradually with depth.

The A horizons of soils under prairie vegetation also differ in other ways from those under other types of vegetation. Exchangeable calcium exhibits little change with depth under prairies but decreases with depth in the A horizons of soils under forestland and oak woodland. Calcium is taken up in excess by trees and bound up in cell walls. Calcium is cycled when foliage and branches are returned to the forest floor by litterfall (Powers, 1976). Well drained soils have lower calcium exchange percentages under prairie than under any other type of vegetation in the survey area. Apparently, the rate at which calcium is cycled by herbaceous vegetation is overwhelmed by the rate of leaching.

The distinctive surface horizons under contrasting vegetation types in the Bald Hills require many years to develop. Birkland (1984) estimates that an A horizon

may require up to a millennium to reach a steady state. The fact that the soils are so well differentiated means that the prairies and oak woodlands in the Bald Hills have persisted largely in their present configuration for many years (USDI, 1999).

The distribution of vegetation and soils seems to result from a complex interplay of several site factors and events. This interplay is still only partially understood (Popenoe and others, 1992). Some of the vegetation patterns probably depend upon fire. If prairies are burned frequently and regularly, the fires can prevent encroachment by Douglas-fir. The fires can kill the Douglas-fir before they reproduce. Many prairie-forest boundaries are at natural firebreaks, such as abrupt changes in slope and drainages, with or without a controlling change in geology or aspect. As a process, fire helps to account for many existing vegetation patterns that are not readily explained on the basis of geology or climate. Although fire can slow or prevent forest encroachment, it does not account well for how grasslands might have originated, replacing the climax conifer forest in such a moist climate. Fires are not known to be stand replacing, particularly at the northern end of redwood's distribution (Agee, 1993).

The initial establishment of the prairies and oak woodlands in the Bald Hills was probably the result of climatic change. According to Heusser (1965), prairies and oak woodlands displaced areas of conifer forest during a time of warmer, drier climate. Then, approximately 2,500 to 2,800 years ago (West, 1983), there was a transition to the present-day, cooler, moister climate, accompanied by a shift back toward conifer forest.

Ugolini and Schlicte (1973) hypothesize that frequent burning by humans helped preserve prairies of western Washington into the modern climate, which favors conifer forest. Remains of the first known permanent settlements in the Bald Hills date to about the time of climatic transition (Eidsness, 1988). Prior to the arrival of Europeans, Native Americans of northwestern California often set fires along ridges to control invasions of trees and brush. Thus, frequent, regular, anthropogenic fire may have been necessary to preserve vegetation boundaries unprotected by geology or climate. If so, such actions by humans would have reinforced the differentiation of A horizons specific to the individual vegetation types present today.

Glossary

AASHTO classification. A system for classifying soils specifically for geotechnical engineering purposes related to highway and airfield construction. It is based on particle-size distribution and Atterberg limits.

AASHTO group index (GI). An empirical index number used to evaluate clayey and silty clay material.

Aeration, soil. The exchange of air in soil with air from the atmosphere. The air in a well aerated soil is similar to that in the atmosphere; the air in a poorly aerated soil is considerably higher in carbon dioxide and lower in oxygen.

Aggregate, soil. Many fine particles held in a single mass or cluster. Natural soil aggregates, such as granules, blocks, or prisms, are called peds. Clods are aggregates produced by tillage or logging.

Alluvial fan. A low, outspread mass of loose material and/or rock material washed down the sides of mountains and hills. It commonly has gentle slopes and is shaped like an open fan or a segment of a cone. It is deposited by a stream at the place where the stream issues from a narrow mountain valley or where a tributary stream is near or at its junction with the main stream. An alluvial fan is steepest near its apex that points upstream, and it slopes gently and convexly outward with a gradual decrease in gradient.

Alluvium. Material, such as sand, silt, or clay, deposited on land by streams.

Alpha,alpha-dipyridyl. A dye that when dissolved in 1N ammonium acetate is used to detect the presence of reduced iron (Fe II) in the soil. A positive reaction indicates a type of redoximorphic feature.

Aquic conditions. Current soil wetness characterized by saturation, reduction, and redoximorphic features.

Aquic moisture regime. See Moisture regime, soil.

Argillic horizon. A subsoil horizon characterized by an accumulation of illuvial clay.

Aspect. The direction in which a slope faces.

Association, soil. A group of soils or miscellaneous areas geographically associated in a characteristic repeating pattern and defined and delineated as a single map unit.

Available water capacity (AWC) (available moisture capacity). The volume of water that should be available to plants if the soil, inclusive of fragments, were at field capacity. It is commonly estimated as the difference between the amount of water at field capacity and the amount at wilting point with adjustments for salinity, fragments, and rooting depth. It is commonly expressed as inches of water per inch of soil. The capacity, in inches, in a 60-inch profile or to a limiting layer is expressed as:

Very low	0 to 2.5
Low	2.5 to 5.0
Moderate.....	5.0 to 7.5
High	7.5 to 10.0
Very high.....	more than 10.0

AWC. See Available water capacity.

Backslope. The hillslope profile position that forms the steepest and generally linear, middle portion of the slope. In profile, backslopes commonly are bounded by a

convex shoulder above and a concave footslope below. They may or may not include cliff segments, or free faces. Backslopes are commonly erosional forms produced by mass movement, colluvial action, and running water.

Bar (coast). A general term for any of the various elongated offshore ridges, banks, or mounds of sand, gravel, or other unconsolidated material submerged at least at high tide and built up by the action of waves or currents, especially at the mouth of a river or estuary or a short distance offshore from the beach.

Bar (microfeature). A small, sinuous or arcuate, ridgelike lineation separated from others similar to it by small channels. It is caused by fluvial processes and is common on flood plains and young alluvial terraces. It is a constituent of bar-and-channel topography.

Bar (streams). A general term for a ridgelike accumulation of sand, gravel, or other alluvial material in the channel, along the banks, or at the mouth of a stream where a decrease in velocity induces deposition. Examples are channel bars and meander bars.

Bar-and-channel topography. A local topography of recurring, small, sinuous or arcuate ridges separated by shallow troughs irregularly spaced across low-relief flood plains (with slopes generally of 2 to 6 percent). The effect is a subdued, sinuously undulating surface that is common on active flood plains. Micro differences in elevation generally range from less than 1 meter to less than 2 meters. The differences in elevation between the bars and channels are largely controlled by the competency of the stream. The ridgelike bars commonly consist of sediment that is coarser than the finer textured sediment of the low-lying areas.

Basal area. The area of a cross section of a tree, generally referring to the section at breast height and measured outside the bark. It is a measure of stand density, commonly expressed in square feet.

Base saturation. The degree to which material having cation-exchange properties is saturated with exchangeable bases (sum of Ca, Mg, Na, and K), expressed as a percentage of the total cation-exchange capacity.

Base slope. A geomorphic component of hills consisting of the concave to linear (perpendicular to the contour) slope that, regardless of the lateral shape, forms an apron or wedge at the bottom of a hillside dominated by colluvium and slope-wash sediments (for example, slope alluvium).

Beach terrace. A landform that consists of a wave-cut scarp and wave-built terrace of well-sorted marine and lacustrine sand and gravel. Colloquially, in the western United States, relict shoreline from pluvial lakes, generally restricted to sides of valleys.

Bedding planes. Fine strata, less than 5 millimeters thick, in unconsolidated alluvial, eolian, lacustrine, or marine sediment.

Bedrock. A general term for the solid rock that underlies the soil and other unconsolidated material or that is exposed at the surface.

Bedrock-controlled topography. A landscape where the configuration and relief of the landforms are determined or strongly influenced by the underlying bedrock.

Bench terrace. A raised, level or nearly level strip of earth constructed on or nearly on a contour, supported by a barrier of rocks or similar material, and designed to make the soil suitable for tillage and to prevent accelerated erosion.

Blowout. A shallow depression from which all or most of the soil material has been removed by the wind. A blowout has a flat or irregular floor formed by a resistant layer or by an accumulation of pebbles or cobbles. In some blowouts the water table is exposed.

Bottom land. The normal flood plain of a stream, subject to flooding.

Boulders. Rock fragments larger than 2 feet (60 centimeters) in diameter.

Breast height. An average height of 4.5 feet above the ground surface; the point on a tree where diameter measurements are ordinarily taken.

Brush management. Use of mechanical, chemical, or biological methods to make

conditions favorable for reseeding or to reduce or eliminate competition from woody vegetation and thus allow understory grasses and forbs to recover. Brush management increases forage production and thus reduces the hazard of erosion. It can improve the habitat for some species of wildlife.

Bulk density. A measurement of the oven-dry weight of the soil material that is less than 2 millimeters in diameter per unit volume. Common measurements are taken at $\frac{1}{3}$ -, $\frac{1}{10}$ -, or 15-bar moisture tension. Bulk density influences plant growth and engineering applications. It is used to convert measurements from a weight basis to a volume basis. Within a family particle-size class, bulk density is an indicator of how well plant roots are able to extend into the soil. Bulk density is used to calculate porosity.

Cable yarding. A method of moving felled trees to a nearby central area for transport to a processing facility. Most cable yarding systems involve use of a drum, a pole, and wire cables in an arrangement similar to that of a rod and reel used for fishing. To reduce friction and soil disturbance, felled trees generally are reeled in while one end is lifted or the entire log is suspended.

Calcium carbonate equivalent. The amount of calcium carbonate in a soil measured by treating the soil sample with hydrochloric acid (HCl). The evolved carbon dioxide (CO_2) is measured, and the amount of carbonate is then calculated as calcium carbonate (CaCO_3).

Cambic horizon. A mineral soil horizon that has the texture of loamy very fine sand or finer, has soil structure rather than rock structure, and contains some weatherable minerals. It is characterized by the alteration or removal of mineral material as indicated by mottling or gray color, stronger chroma or redder hue than the underlying horizons, or the removal of carbonates. The cambic horizon lacks cementation or induration and has too little evidence of illuviation to meet the requirements for an argillic horizon.

Canopy. The leafy crown of trees or shrubs. (See Crown.)

Capillary water. Water held as a film around soil particles and in tiny spaces between particles. Surface tension is the adhesive force that holds capillary water in the soil.

Catena. A sequence of soils on a landscape that are about the same age and formed in similar kinds of parent material under similar climatic conditions but have different characteristics as a result of differences in relief and drainage.

Cathodic protection. Control of the electrolytic corrosion of an underground or underwater metallic structure, such as a pipeline, by the application of an electrical current in such a way that the structure acts as the cathode rather than the anode of an electrolytic cell. (See Coatings for pipelines.)

Cation. An ion carrying a positive charge of electricity. The common soil cations are calcium, potassium, magnesium, sodium, and hydrogen.

Cation-exchange capacity (CEC). The total amount of exchangeable cations that can be held by the soil, expressed in terms of milliequivalents per 100 grams of soil at neutrality (pH 7.0) or at some other stated pH value. The term, as applied to soils, is synonymous with base-exchange capacity but is more precise in meaning.

CEC. See Cation-exchange capacity.

Channery soil material. Soil material that has, by volume, 15 to 35 percent thin, flat fragments of sandstone, shale, slate, limestone, or schist as much as 6 inches (15 centimeters) along the longest axis. A single piece is called a channer.

Chemical treatment. Control of unwanted vegetation through the use of chemicals.

Clay. As a soil separate, the mineral soil particles less than 0.002 millimeter in diameter. As a soil textural class, soil material that is 40 percent or more clay, less than 45 percent sand, and less than 40 percent silt.

Clay depletions. Low-chroma zones having a low content of iron, manganese, and clay because of the chemical reduction of iron and manganese and the removal of iron, manganese, and clay. A type of redoximorphic depletion.

Clayey. Sandy clay, silty clay, and clay soil textures.

Clay film. A thin coating of oriented clay on the surface of a soil aggregate or lining pores or root channels. Synonyms: clay coating, clay skin.

Climax plant community. The stabilized plant community on a particular site. The plant cover reproduces itself and does not change so long as the environment remains the same.

Coarse fragments. See Rock fragments.

Coarse textured soil. Sand or loamy sand.

Coatings for pipelines. Coatings used as a barrier to the flow of electricity and moisture, thereby preventing the formation of corrosion cells.

Cobble (or cobblestone). A rounded or partly rounded fragment of rock 3 to 10 inches (7.6 to 25 centimeters) in diameter.

Cobbly soil material. Material that has 15 to 35 percent, by volume, rounded or partially rounded rock fragments 3 to 10 inches (7.6 to 25 centimeters) in diameter. Very cobbly soil material has 35 to 60 percent of these rock fragments, and extremely cobbly soil material has more than 60 percent.

COLE (coefficient of linear extensibility). See Linear extensibility percent.

Colluvium. Unconsolidated, unsorted earth material transported or deposited on side slopes and/or at the base of slopes by mass movement, or direct gravitational action, and by local unconcentrated runoff.

Compaction. The process by which the soil grains are rearranged to decrease void space and bring them into closer contact with one another, thereby increasing bulk density.

Complex slope. Irregular or variable slope. Planning or establishing terraces, diversions, and other water-control structures on a complex slope is difficult.

Complex, soil. A map unit of two or more kinds of soil or miscellaneous areas in such an intricate pattern or so small in area that it is not practical to map them separately at the selected scale of mapping. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas.

Concretions. Cemented bodies with crude internal symmetry organized around a point, a line, or a plane. They typically take the form of concentric layers visible to the naked eye. Calcium carbonate, iron oxide, and manganese oxide are common compounds making up concretions. If formed in place, concretions of iron oxide or manganese oxide are generally considered a type of redoximorphic concentration.

Confidence limits. Two statistics between which, with a specified degree of probability, the parameter being estimated is expected to lie.

Conglomerate. A coarse grained, clastic sedimentary rock composed of rounded or subangular rock fragments more than 2 millimeters in diameter, commonly with a matrix of sand and finer textured material. Cementing agents include silica, calcium carbonate, and iron oxide. Conglomerate is the consolidated equivalent of gravel.

Conservation cropping system. Growing crops in combination with needed cultural and management practices. In a good conservation cropping system, the soil-improving crops and practices more than offset the effects of the soil-depleting crops and practices. Cropping systems are needed on all tilled soils. Soil-improving practices in a conservation cropping system include the use of rotations that contain grasses and legumes and the return of crop residue to the soil. Other practices include the use of green manure crops of grasses and legumes, proper tillage, adequate fertilization, and weed and pest control.

Conservation tillage. A tillage system that does not invert the soil and that leaves a protective amount of crop residue on the surface throughout the year.

Consistence, soil. Refers to the degree of cohesion and adhesion of soil material and its resistance to deformation when ruptured. Consistence includes resistance of soil material to rupture and to penetration; plasticity, toughness, and stickiness

of puddled soil material; and the manner in which the soil material behaves when subject to compression. Terms describing consistence are defined in the "Soil Survey Manual."

Contour stripcropping. Growing crops in strips that follow the contour. Strips of grass or close-growing crops are alternated with strips of clean-tilled crops or summer fallow.

Control section. The part of the soil on which classification is based. The thickness varies among different kinds of soil, but for many it is that part of the soil profile between depths of 10 inches and 40 or 80 inches.

Corrosion. Soil-induced electrochemical or chemical action that dissolves or weakens concrete or uncoated steel.

Cover crop. A close-growing crop grown primarily to improve and protect the soil between periods of regular crop production, or a crop grown between trees and vines in orchards and vineyards.

Cropping system. Growing crops according to a planned system of rotation and management practices.

Crop residue management. Returning crop residue to the soil, which helps to maintain soil structure, organic matter content, and fertility and helps to control erosion.

Cross-slope farming. Deliberately conducting farming operations on sloping farmland in such a way that tillage is across the general slope.

Crown. The upper part of a tree or shrub, including the living branches and their foliage.

Culmination of the mean annual increment (CMAI). The average annual increase per acre in the volume of a stand. Computed by dividing the total volume of the stand by its age. As the stand increases in age, the mean annual increment continues to increase until mortality begins to reduce the rate of increase. The point where the stand reaches its maximum annual rate of growth is called the culmination of the mean annual increment.

Debris flow (mass movement). The process, associated sediment (debris flow deposit), or resultant landform characterized by a very rapid type of flow dominated by sudden downslope movement of a mass of rock, soil, and mud (more than 50 percent particles that are more than 2 millimeters in size) that behaves much like viscous fluid whether it is saturated or relatively dry.

Decreasers. The most heavily grazed climax range plants. Because they are the most palatable, they are the first to be destroyed by overgrazing.

Deep soil. See Depth, soil.

Deferred grazing. Postponing grazing or resting grazing land for a prescribed period.

Depth, soil. Generally, the thickness of the soil over bedrock. Very deep soils are more than 60 inches deep over bedrock; deep soils, 40 to 60 inches; moderately deep, 20 to 40 inches; shallow, 10 to 20 inches; and very shallow, less than 10 inches.

Depth to bedrock (in tables). Bedrock is too near the surface for the specified use.

Divided-slope farming. A form of field stripcropping in which crops are grown in a systematic arrangement of two strips, or bands, across the slope to reduce the hazard of water erosion. One strip is in a close-growing crop that provides protection from erosion, and the other strip is in a crop that provides less protection from erosion. This practice is used where slopes are not long enough to permit a full stripcropping pattern to be used.

Drainage class (natural). Refers to the frequency and duration of wet periods under conditions similar to those under which the soil formed. Alterations of the water regime by human activities, either through drainage or irrigation, are not a consideration unless they have significantly changed the morphology of the soil. Seven classes of natural soil drainage are recognized—*excessively drained*,

somewhat excessively drained, well drained, moderately well drained, somewhat poorly drained, poorly drained, and very poorly drained. These classes are defined in the "Soil Survey Manual."

Drainage, surface. Runoff, or surface flow of water, from an area.

Drainageway. A general term for a course or channel along which water moves in draining an area.

Draw. A small stream channel that generally is more open and has a broader floor than a ravine or gulch.

Duff. A generally firm organic layer on the surface of mineral soils. It consists of fallen plant material that is in the process of decomposition and includes everything from the litter on the surface to underlying pure humus.

Dune. A low mound, ridge, bank, or hill of loose, windblown, granular material (generally sand), either barren or covered with vegetation, that is capable of movement from place to place but always retains its characteristic shape.

Earthflow. Slow to rapid mass wasting of fine-grained slope material that moves downslope as a viscous fluid.

EC. See Electrical conductivity.

Ecological site. An area where climate, soil, and relief are sufficiently uniform to produce a distinct natural plant community. An ecological site is the product of all the environmental factors responsible for its development. It is typified by an association of species that differ from those on other ecological sites in kind and/or proportion of species or in total production.

Electrical conductivity (EC). The electrolytic conductivity of an extract from saturated soil paste.

Eluviation. The movement of material in true solution or colloidal suspension from one place to another within the soil. Soil horizons that have lost material through eluviation are eluvial; those that have received material are illuvial.

Endosaturation. A type of saturation of the soil in which all horizons between the upper boundary of saturation and a depth of 2 meters are saturated.

Eolian material. Material transported and deposited by wind, including earth material such as dune sand, sand sheets, loess, and clay.

Ephemeral stream. A stream, or reach of a stream, that flows only in direct response to precipitation. It receives no long-continued supply from melting snow or other source, and its channel is above the water table at all times.

Episaturation. A type of saturation indicating a perched water table in a soil in which saturated layers are underlain by one or more unsaturated layers within 2 meters of the surface.

Erosion. The wearing away of the land surface by water, wind, ice, or other geologic agents and by such processes as gravitational creep.

Erosion (geologic). Erosion caused by geologic processes acting over long geologic periods and resulting in the wearing away of mountains and the building up of such landscape features as flood plains and coastal plains.
Synonym: natural erosion.

Erosion (accelerated). Erosion much more rapid than geologic erosion, mainly as a result of human or animal activities or of a catastrophe in nature, such as a fire, that exposes the surface.

Escarpment. A relatively continuous and steep slope or cliff breaking the general continuity of more gently sloping land surfaces and resulting from erosion or faulting. The term is most commonly applied to cliffs produced by differential erosion. Synonym: scarp.

Fallow. Cropland left idle in order to restore productivity through accumulation of moisture. Summer fallow is common in regions of limited rainfall where cereal grain is grown. The soil is tilled for at least one growing season for weed control and decomposition of plant residue.

- Family, soil.** The most specific hierarchical category in soil taxonomy.
- Fan remnant.** A general term for landforms that are the remaining parts of older fan landforms, such as alluvial fans, fan aprons, inset fans, and fan skirts, that either have been dissected (erosional fan remnants) or partially buried (nonburied fan remnants). An erosional fan remnant has a relatively flat summit that is a relict fan surface. A nonburied fan remnant is a relict surface in its entirety.
- Fan terrace.** See Fan remnant.
- Fertility, soil.** The quality that enables a soil to provide plant nutrients, in adequate amounts and in proper balance, for the growth of specified plants when light, moisture, temperature, tilth, and other growth factors are favorable.
- Fibric soil material (peat).** The least decomposed of all organic soil material. Peat contains a large amount of well preserved fiber that is readily identifiable according to botanical origin. Peat has the lowest bulk density and the highest water content at saturation of all organic soil material.
- Field moisture capacity.** The moisture content of a soil, expressed as a percentage of the oven-dry weight, after the gravitational, or free, water has drained away; the field moisture content 2 or 3 days after a soaking rain; also called *normal field capacity*, *normal moisture capacity*, or *capillary capacity*.
- Fine textured soil.** Sandy clay, silty clay, or clay.
- Flaggy soil material.** Material that has, by volume, 15 to 35 percent flagstones. Very flaggy soil material has 35 to 60 percent flagstones, and extremely flaggy soil material has more than 60 percent flagstones.
- Flagstone.** A thin fragment of sandstone, limestone, slate, shale, or (rarely) schist 6 to 15 inches (15 to 38 centimeters) long.
- Flood plain.** The nearly level plain that borders a stream and is subject to inundation under floodstage conditions unless protected artificially. It is commonly a constructional landform consisting of sediment deposited during overflow and lateral migration of a stream.
- Fluvial.** Of or pertaining to rivers; produced by river action.
- Foothill.** A steeply sloping upland that has relief of as much as 1,000 feet (300 meters) and fringes a mountain range or high-plateau escarpment.
- Footslope.** The position that forms the inner, gently inclined surface at the base of a hillslope. In profile, footslopes are commonly concave. A footslope is a transition zone between upslope sites of erosion and transport (shoulders and backslopes) and downslope sites of deposition (toeslopes).
- Forb.** Any herbaceous plant not a grass or a sedge.
- Forest cover.** All trees and other woody plants (underbrush) covering the ground in a forest.
- Forest type.** A stand of trees similar in composition and development because of given physical and biological factors by which it may be differentiated from other stands.
- Fragments.** Unattached cemented pieces of bedrock, bedrocklike material, durinodes, concretions, and nodules 2 millimeters in diameter or larger in mineral soils; woody material 20 millimeters in diameter or larger in organic soils.
- Genesis, soil.** The mode of origin of the soil. Refers especially to the processes or soil-forming factors responsible for the formation of the solum, or true soil, from the unconsolidated parent material.
- Gleyed soil.** Soil that formed under poor drainage, resulting in the reduction of iron and other elements in the profile and in gray colors.
- Graded stripcropping.** Growing crops in strips that grade toward a protected waterway.
- Grassed waterway.** A natural or constructed waterway, typically broad and shallow, seeded to grass as protection against erosion. Conducts surface water away from cropland.

- Gravel.** Rounded or angular fragments of rock as much as 3 inches (2 millimeters to 7.6 centimeters) in diameter. An individual piece is a pebble.
- Gravelly soil material.** Material that has 15 to 35 percent, by volume, rounded or angular rock fragments, not prominently flattened, as much as 3 inches (7.6 centimeters) in diameter.
- Graywacke.** A sandstone with more than 15 percent fine-grained matrix between sand grains. A “dirty sandstone.”
- Green manure crop** (agronomy). A soil-improving crop grown to be plowed under in an early stage of maturity or soon after maturity.
- Ground water.** Water filling all the unblocked pores of the material below the water table.
- Gully.** A small channel with steep sides cut by the concentrated, but intermittent, flow of water commonly during and immediately following heavy rainfall or following icemelt or snowmelt. A gully generally is an obstacle to wheeled vehicles and is too deep to be obliterated by ordinary tillage; a rill is of lesser depth and can be smoothed over by ordinary tillage.
- Gypsum content.** The percent, by weight, of hydrated calcium sulfates in the fraction of the soil less than 20 millimeters in size.
- Hard bedrock.** Bedrock that cannot be excavated except by blasting or by the use of special equipment that is not commonly used in construction.
- Hemic soil material (mucky peat).** Organic soil material intermediate in degree of decomposition between the less decomposed fibric material and the more decomposed sapric material.
- High-residue crops.** Such crops as small grain and corn used for grain. If properly managed, residue from these crops can be used to control erosion until the next crop in the rotation is established. These crops return large amounts of organic matter to the soil.
- Hill.** A generic term for an area of the land surface that rises as much as 1,000 feet (300 meters) above surrounding lowlands, commonly has restricted summit area relative to surrounding surfaces, and has a well-defined outline; hillsides generally have slopes of more than 15 percent. The distinction between a hill and a mountain is arbitrary and commonly is dependent on local usage.
- Holocene.** The epoch of the Quaternary period of geologic time that extends from the end of the Pleistocene (about 10 to 12 thousand years ago) to the present.
- Horizon, soil.** A layer of soil, approximately parallel to the surface, having distinct characteristics produced by soil-forming processes. In the identification of soil horizons, an uppercase letter represents the major horizons. Numbers or lowercase letters that follow represent subdivisions of the major horizons. An explanation of the subdivisions is given in the “Soil Survey Manual.” The major horizons of mineral soil are as follows:
- O horizon.*—An organic layer of fresh and decaying plant residue.
- A horizon.*—The mineral horizon at or near the surface in which an accumulation of humified organic matter is mixed with the mineral material. Also, a plowed surface horizon, most of which was originally part of a B horizon.
- E horizon.*—The mineral horizon in which the main feature is loss of silicate clay, iron, aluminum, or some combination of these.
- B horizon.*—The mineral horizon below an A horizon. The B horizon is in part a layer of transition from the overlying A to the underlying C horizon. The B horizon also has distinctive characteristics, such as (1) accumulation of clay, sesquioxides, humus, or a combination of these; (2) prismatic or blocky structure; (3) redder or browner colors than those in the A horizon; or (4) a combination of these.
- C horizon.*—The mineral horizon or layer, excluding indurated bedrock, that is little affected by soil-forming processes and does not have the properties typical

of the overlying soil material. The material of a C horizon may be either like or unlike that in which the solum formed. If the material is known to differ from that in the solum, an Arabic numeral, commonly a 2, precedes the letter C.

Cr horizon.—Soft, consolidated bedrock beneath the soil.

R layer.—Consolidated bedrock beneath the soil. The bedrock commonly underlies a C horizon, but it can be directly below an A or a B horizon.

Hummock. Rounded or conical mound or other small rise.

Humus. The well decomposed, more or less stable part of the organic matter in mineral soils.

Hydrologic soil groups. Refers to soils grouped according to their runoff potential.

The soil properties that influence this potential are those that affect the minimum rate of water infiltration on a bare soil during periods after prolonged wetting when the soil is not frozen. These properties are depth to a seasonal high water table, the infiltration rate and permeability after prolonged wetting, and depth to a very slowly permeable layer. The slope and the kind of plant cover are not considered but are separate factors in predicting runoff.

Illuviation. The movement of soil material from one horizon to another in the soil profile. Generally, material is removed from an upper horizon and deposited in a lower horizon.

Impervious soil. A soil through which water, air, or roots penetrate slowly or not at all. No soil is absolutely impervious to air and water all the time.

Increasesers. Species in the climax vegetation that increase in amount as the more desirable plants are reduced by close grazing. Increasesers commonly are the shorter plants and the less palatable to livestock.

Infiltration. The downward entry of water into the immediate surface of soil or other material, as contrasted with percolation, which is movement of water through soil layers or material.

Infiltration capacity. The maximum rate at which water can infiltrate into a soil under a given set of conditions.

Infiltration rate. The rate at which water penetrates the surface of the soil at any given instant, usually expressed in inches per hour. The rate can be limited by the infiltration capacity of the soil or the rate at which water is applied at the surface.

Inset fan. Specific name for the flood plain of an ephemeral stream that is confined between fan remnants, ballenas, basin floor remnants, or closely opposed fan toeslopes of a basin.

Intake rate. The average rate of water entering the soil under irrigation. Most soils have a fast initial rate; the rate decreases with application time. Therefore, intake rate for design purposes is not a constant but is a variable depending on the net irrigation application. The rate of water intake, in inches per hour, is expressed as follows:

Less than 0.2	very low
0.2 to 0.4	low
0.4 to 0.75	moderately low
0.75 to 1.25	moderate
1.25 to 1.75	moderately high
1.75 to 2.5	high
More than 2.5	very high

Intermittent stream. A stream, or reach of a stream, that does not flow year-round (commonly is dry for 3 months or more annually), and its channel generally is below the local water table. It flows only when it receives baseflow during wet periods or when it receives ground-water discharge or long, continued contributions from melting snow or other surface and shallow subsurface sources.

Invaders. On range, plants that encroach into an area and grow after the climax vegetation has been reduced by grazing. Generally, plants invade following disturbance of the surface.

- Iron depletions.** Low-chroma zones having a low content of iron and manganese oxide because of chemical reduction and removal, but having a clay content similar to that of the adjacent matrix. A type of redoximorphic depletion.
- Irrigation.** Application of water to soils to assist in production of crops. Methods of irrigation are:
- Basin.*—Water is applied rapidly to nearly level plains surrounded by levees or dikes.
 - Border.*—Water is applied at the upper end of a strip in which the lateral flow of water is controlled by small earth ridges called border dikes, or borders.
 - Controlled flooding.*—Water is released at intervals from closely spaced field ditches and distributed uniformly over the field.
 - Corrugation.*—Water is applied to small, closely spaced furrows or ditches in fields of close-growing crops or in orchards so that it flows in only one direction.
 - Drip (or trickle).*—Water is applied slowly and under low pressure to the surface of the soil or into the soil through such applicators as emitters, porous tubing, or perforated pipe.
 - Furrow.*—Water is applied in small ditches made by cultivation implements. Furrows are used for tree and row crops.
 - Sprinkler.*—Water is sprayed over the soil surface through pipes or nozzles from a pressure system.
 - Subirrigation.*—Water is applied in open ditches or tile lines until the water table is raised enough to wet the soil.
- Isomesic temperature regime.** See Temperature regime, soil.
- K factor.** A measurement of potential soil erodibility caused by detachment of soil particles by water.
- Landform.** A discrete, natural, individual feature of the earth's surface that is mappable at common survey scales. Examples include alluvial fans, flood plains, and hillslopes.
- Landscape.** A broad assemblage or unique group of natural, spatially associated features. Examples include alluvial plains, mountains, and uplands.
- Landslide.** The rapid downhill movement of a mass of soil and loose rock, generally when wet or saturated. The speed and distance of movement, as well as the amount of soil and rock material, vary greatly.
- Leaching.** The removal of soluble material from soil or other material by percolating water.
- LEP.** See Linear extensibility percent.
- Linear extensibility percent (LEP).** The linear expression of the volume difference between the water content of the natural soil fabric at $1/3$ -bar or $1/10$ -bar and oven dryness. The volume change is reported as a percent for the whole soil.
- Liquid limit (LL).** The moisture content at which the soil passes from a plastic to a liquid state.
- LL.** See Liquid limit.
- Loam.** Soil material that is 7 to 27 percent clay particles, 28 to 50 percent silt particles, and less than 52 percent sand particles.
- Loamy.** Coarse sandy loam, sandy loam, fine sandy loam, very fine sandy loam, loam, silt loam, silt, clay loam, sandy clay loam, and silty clay loam soil textures.
- Loess.** Material transported and deposited by wind that consists dominantly of silt-sized clastics.
- Low-residue crops.** Such crops as corn used for silage, peas, beans, and potatoes. Residue from these crops is not adequate to control erosion until the next crop in the rotation is established. These crops return little organic matter to the soil.
- Low strength.** The soil is not strong enough to support loads.
- Masses.** Concentrations of substances in the soil matrix that do not have a clearly defined boundary with the surrounding soil material and cannot be removed as

a discrete unit. Common compounds making up masses are calcium carbonate, gypsum or other soluble salts, iron oxide, and manganese oxide. Masses consisting of iron oxide or manganese oxide generally are considered a type of redoximorphic concentration.

Mechanical treatment. Use of mechanical equipment for seeding, brush management, and other management practices.

Medium textured soil. Very fine sandy loam, loam, silt loam, or silt.

Mesic temperature regime. See Temperature regime, soil.

Metamorphic rock. Rock of any origin altered in mineralogical composition, chemical composition, or structure by heat, pressure, and movement in the earth's crust. Nearly all such rocks are crystalline. Examples are schist, gneiss, quartzite, slate, and marble.

Metasediment. A sediment or sedimentary rock that shows evidence of having been subjected to metamorphism.

Mineral soil. Soil that is mainly mineral material and low in organic material. Its bulk density is more than that of organic soil.

Minimum tillage. Only the tillage essential to crop production and prevention of soil damage.

Miscellaneous area. An area that has little or no natural soil and supports little or no vegetation.

Moderately coarse textured soil. Coarse sandy loam, sandy loam, or fine sandy loam.

Moderately deep soil. See Depth, soil.

Moderately fine textured soil. Clay loam, sandy clay loam, or silty clay loam.

Moisture regime, soil. Refers to the presence or absence either of ground water or of water held at a tension of less than 1,500 kPa in the soil or in specific horizons during periods of the year.

Aquic.—The moisture regime in which the soil, for some period of time, is virtually free of dissolved oxygen because it is saturated by water. Redoximorphic features are common.

Oxyaquic.—The moisture subregime in which the soil, for some period of time, is saturated but dissolved oxygen is still present. Redoximorphic features are uncommon.

Udic.—The moisture regime in which the amount of stored moisture in the soil is approximately equal to, or exceeds, the amount of evapotranspiration. This regime is common along the north coast of California where winters are moist and cool and summers are cool and foggy.

Ustic.—The moisture regime that is intermediate between the aridic and udic regimes. This regime is common in temperate subhumid or semiarid regions and in tropical and subtropical regions that have a monsoon climate. A limited amount of water is available for plants, but availability occurs when the soil temperature is optimum for plant growth.

Xeric.—The typical moisture regime in areas of Mediterranean climates, where it is moist and cool in winter and warm and dry in summer. When potential evapotranspiration is at a minimum, the moisture, which falls in winter, is particularly effective in leaching. The mean annual soil temperature is less than 22 degrees C, and the difference between the mean summer and mean winter soil temperature is 6 degrees.

Mollic epipedon. A thick, dark, humus-rich surface horizon (or horizons) that has high base saturation and pedogenic soil structure. It may include the upper part of the subsoil.

Morphology, soil. The physical makeup of the soil, including the texture, structure, porosity, consistence, color, and other physical, mineral, and biological properties of the various horizons, and the thickness and arrangement of those horizons in the soil profile.

Mottling, soil. Irregular spots of different colors that vary in number and size.

Descriptive terms are as follows: abundance—*few*, *common*, and *many*; size—*fine*, *medium*, and *coarse*; and contrast—*faint*, *distinct*, and *prominent*. The size measurements are of the diameter along the greatest dimension. *Fine* indicates less than 5 millimeters (about 0.2 inch); *medium*, from 5 to 15 millimeters (about 0.2 to 0.6 inch); and *coarse*, more than 15 millimeters (about 0.6 inch).

Mountain. A natural elevation of the land surface that rises more than 1,000 feet (300 meters) above surrounding lowlands, commonly has limited summit area relative to surrounding surfaces, and generally has steep sides (slopes of more than 25 percent) with or without considerable bare-rock surface. A mountain can occur as a single, isolated mass or in a group forming a chain or range. Mountains are formed primarily by tectonic and/or volcanic activity and by differential erosion.

Muck. Unconsolidated soil material consisting primarily of highly decomposed organic material in which the original plants are not recognizable. It generally contains more mineral material and is darker in color than peat. (See Sapric soil material.)

Mudstone. A blocky or massive, fine-grained sedimentary rock indurated by clay and silt in approximately equal amounts. Also, a general term for clay, silt, claystone, siltstone, shale, and argillite that is used only when the amounts of clay and silt are not known or cannot be precisely determined.

Munsell notation. A designation of color by degrees of three simple variables—hue, value, and chroma. For example, a notation of 10YR 6/4 is a color with hue of 10YR, value of 6, and chroma of 4.

Neutral soil. A soil having a pH value of 6.6 to 7.3. (See Reaction, soil.)

Nose slope. A geomorphic component of hills consisting of the projecting end (laterally convex area) of a hillside. The overland waterflow is predominantly divergent.

Nutrient, plant. Any element taken in by a plant essential to its growth. Plant nutrients are mainly nitrogen, phosphorus, potassium, calcium, magnesium, sulfur, iron, manganese, copper, boron, and zinc obtained from the soil and carbon, hydrogen, and oxygen obtained from the air and water.

Ochric epipedon. In a mineral soil, a surface horizon that is too light in color, too high in chroma, too low in organic carbon, or too thin to be a plaggen, mollic, umbric, anthropic, or histic epipedon or that is both hard and massive when dry.

OM. See Organic matter.

Organic matter (OM). Plant and animal residue in the soil in various stages of decomposition. The content of organic matter in the surface layer is described as follows:

Very low	less than 0.5 percent
Low	0.5 to 1.0 percent
Moderately low.....	1.0 to 2.0 percent
Moderate.....	2.0 to 4.0 percent
High	4.0 to 8.0 percent
Very high.....	more than 8.0 percent

Oxyaquic moisture regime. See Moisture regime, soil.

Paleosol. A soil that formed in a particular area with distinctive morphological features resulting from a soil-forming environment that no longer exists in the area. The pedogenic process was either altered as a result of external environmental changes or interrupted by burial. A paleosol (or component horizon) is classified as relict if it has persisted without major alteration of morphology by the prevailing pedogenic environment. An exhumed paleosol is one that was buried and has been re-exposed by erosion of the mantle. Most paleosols have been affected by some subsequent modification of the morphology of diagnostic horizons and truncation of the profile.

Parent material. The unconsolidated and chemically weathered mineral and organic material in which the solum of a soil is formed as a result of pedogenic processes.

Peat. Unconsolidated soil material consisting largely of undecomposed or slightly decomposed organic matter that has accumulated under excessive moisture conditions. (See Fibric soil material.)

Ped. An individual natural soil aggregate, such as a granule, a prism, or a block.

Pedon. The smallest volume that can be called “a soil.” A pedon is three dimensional and large enough to permit study of all horizons. Its area ranges from about 10 to 100 square feet (1 square meter to 10 square meters), depending on the variability of the soil.

Perched water table. The upper surface of unconfined ground water separated from an underlying main body of ground water by an unsaturated zone.

Percolation. The downward movement of water through the soil.

Permeability. The quality of the soil that enables water or air to move downward through the profile. The rate at which a saturated soil transmits water is accepted as a measure of this quality. In soil physics, the rate is referred to as “saturated hydraulic conductivity,” which is defined in the “Soil Survey Manual.” In line with conventional usage in the engineering profession and with traditional usage in published soil surveys, this rate of flow continues to be expressed as “permeability.” Terms describing permeability, measured in inches per hour, are as follows:

Extremely slow.....	0.0 to 0.01 inch
Very slow	0.01 to 0.06 inch
Slow	0.06 to 0.2 inch
Moderately slow.....	0.2 to 0.6 inch
Moderate.....	0.6 inch to 2.0 inches
Moderately rapid.....	2.0 to 6.0 inches
Rapid	6.0 to 20 inches
Very rapid.....	more than 20 inches

Phase, soil. A subdivision of a soil series based on features that affect its use and management, such as slope, stoniness, and flooding.

pH value. A numerical designation of acidity and alkalinity in soil. (See Reaction, soil.)

PI. See Plasticity index.

Plasticity index (PI). The numerical difference between the liquid limit and the plastic limit; the range of moisture content within which the soil remains plastic.

Plastic limit. The moisture content at which a soil changes from semisolid to plastic.

Pleistocene. The epoch of the Quaternary period of geologic time following the Pliocene and preceding the Holocene (approximately 2 million to 10 thousand years ago). Also refers to the corresponding (time-stratigraphic) “series” of earth material.

Plinthite. The sesquioxide-rich, humus-poor, highly weathered mixture of clay with quartz and other diluents. It commonly appears as red mottles, usually in platy, polygonal, or reticulate patterns. Plinthite changes irreversibly to an ironstone hardpan or to irregular aggregates on repeated wetting and drying, especially if it is exposed also to heat from the sun. In a moist soil, plinthite can be cut with a spade. It is a form of laterite.

Plowpan. A compacted layer formed in the soil directly below the plowed layer.

Ponding. Standing water on soils in closed depressions. Unless the soils are artificially drained, the water can be removed only by percolation or evapotranspiration.

Poorly graded. Refers to a coarse grained soil or soil material consisting mainly of particles of nearly the same size. Because there is little difference in size of the particles, density can be increased only slightly by compaction.

Potential native plant community. See Climax plant community.

Potential rooting depth (effective rooting depth). Depth to which roots could penetrate if the content of moisture in the soil were adequate. The soil has no properties restricting the penetration of roots to this depth.

Prescribed burning. Deliberately burning an area for specific management purposes, under the appropriate conditions of weather and soil moisture and at the proper time of day.

- Productivity, soil.** The capability of a soil for producing a specified plant or sequence of plants under specific management.
- Profile, soil.** A vertical section of the soil extending through all its horizons and into the parent material.
- Proper grazing use.** Grazing at an intensity that maintains enough cover to protect the soil and maintain or improve the quantity and quality of the desirable vegetation. This practice increases the vigor and reproduction capacity of the key plants and promotes the accumulation of litter and mulch necessary to conserve soil and water.
- Range condition.** The present composition of the plant community on a range site in relation to the potential natural plant community for that site. Range condition is expressed as excellent, good, fair, or poor on the basis of how much the present plant community differs from the potential.
- Rangeland.** Land on which the potential natural vegetation is predominantly grasses, grasslike plants, forbs, or shrubs. It includes natural grasslands, savannas, many wetlands, some deserts, tundras, and areas that support certain forb and shrub communities.
- Range site.** An area of rangeland where climate, soil, and relief are sufficiently uniform to produce a distinct natural plant community. A range site is the product of all the environmental factors responsible for its development. It is typified by an association of species that differ from those on other range sites in kind, proportion, and total production.
- Reaction, soil.** A measure of acidity or alkalinity of a soil, expressed in pH values. A soil that tests to pH 7.0 is described as precisely neutral in reaction because it is neither acid nor alkaline. The degrees of acidity or alkalinity, expressed as pH values, are:

Ultra acid.....	less than 3.5
Extremely acid	3.5 to 4.4
Very strongly acid	4.5 to 5.0
Strongly acid.....	5.1 to 5.5
Moderately acid	5.6 to 6.0
Slightly acid.....	6.1 to 6.5
Neutral	6.6 to 7.3
Slightly alkaline	7.4 to 7.8
Moderately alkaline.....	7.9 to 8.4
Strongly alkaline	8.5 to 9.0
Very strongly alkaline.....	9.1 and higher

- Redoximorphic concentrations.** Nodules, concretions, soft masses, pore linings, and other features resulting from the accumulation of iron or manganese oxide. An indication of chemical reduction and oxidation resulting from saturation.
- Redoximorphic depletions.** Low-chroma zones from which iron and manganese oxide or a combination of iron and manganese oxide and clay has been removed. These zones are indications of the chemical reduction of iron resulting from saturation.
- Redoximorphic features.** Redoximorphic concentrations, redoximorphic depletions, reduced matrices, a positive reaction to alpha,alpha-dipyridyl, and other features indicating the chemical reduction and oxidation of iron and manganese compounds resulting from saturation.
- Reduced matrix.** A soil matrix that has low chroma in situ because of chemically reduced iron (Fe II). The chemical reduction results from nearly continuous wetness. The matrix undergoes a change in hue or chroma within 30 minutes after exposure to air as the iron is oxidized (Fe III). A type of redoximorphic feature.
- Regolith.** All unconsolidated earth material above the solid bedrock. It includes material weathered in place from all kinds of bedrock and alluvial, glacial, eolian, lacustrine, and pyroclastic deposits. Soil scientists regard as soil only that part of

the regolith that has been modified by organisms and soil-forming processes.

Most engineers describe the entire regolith, even to a great depth, as "soil."

Relief. The elevations or inequalities of a land surface, considered collectively.

Remnant. The remaining part of a larger landform or land surface that has been dissected or partially buried.

Residuum (residual soil material). Unconsolidated, weathered or partly weathered mineral material that accumulated as consolidated rock disintegrated in place.

Rill. A small steep-sided channel resulting from erosion. It is cut by a concentrated, but intermittent, flow of water, usually during and immediately following moderate rains or following icemelt or snowmelt. Generally, a rill is not an obstacle to wheeled vehicles and is shallow enough to be obliterated by ordinary tillage.

Riverwash. Barren alluvial areas of unstabilized sand, silt, clay, or gravel reworked frequently by stream activity.

Road cut. A sloping surface produced by mechanical means during road construction. It is commonly on the uphill side of the road.

Rock fragments. Rock or mineral fragments having a diameter of 2 millimeters or more; for example, pebbles, cobbles, stones, and boulders.

Rock outcrop. Exposures of bedrock, excluding lava and rock-lined pits.

Root zone. The part of the soil that can be penetrated by plant roots.

Runoff. The precipitation discharged into stream channels from an area. The water that flows off the surface of the land without sinking into the soil is called surface runoff. Water that enters the soil before reaching surface streams is called ground-water runoff or seepage flow from ground water.

Saline-sodic soil. A soil that contains sufficient exchangeable sodium to interfere with the growth of most crops and appreciable quantities of soluble salts. The exchangeable sodium ratio is greater than 0.15; the conductivity of the soil solution, when saturated, is greater than 4 decisiemens per meter (at 25 degrees C); and the pH is commonly 8.5 or less when the soil is saturated.

Saline soil. A soil containing soluble salts in an amount that impairs growth of plants. A saline soil does not contain excess exchangeable sodium. Salinity is expressed as the electrical conductivity of a saturation extract at 25 degrees C. Salinity classes, expressed in millimhos per centimeter, are as follows:

Nonsaline.....	0 to 2
Very slightly saline	2 to 4
Slightly saline.....	4 to 8
Moderately saline.....	8 to 16
Strongly saline	more than 16

Sand. As a soil separate, individual rock or mineral fragments from 0.05 millimeter to 2.0 millimeters in diameter. Most sand grains consist of quartz. As a soil textural class, a soil that is 85 percent or more sand and not more than 10 percent clay.

Sandstone. Sedimentary rock containing dominantly sand-sized particles.

Sandy. Sand and loamy sand soil textures.

Sapric soil material (muck). The most highly decomposed of all organic soil material. Muck has the least amount of plant fiber, the highest bulk density, and the lowest water content at saturation of all organic soil material.

SAR. See Sodium adsorption ratio.

Saturation. Wetness characterized by zero or positive pressure of the soil water. Under conditions of saturation, the water will flow from the soil matrix into an unlined auger hole.

Scarification. The act of abrading, scratching, loosening, crushing, or modifying the surface to increase water absorption or to provide a more tillable soil.

Sedimentary rock. A consolidated deposit of clastic particles, chemical precipitates, or organic matter accumulated at or near the surface of the earth under

“normal” low temperature and pressure conditions. Sedimentary rock includes the consolidated equivalents of alluvial, colluvial, drift, eolian, lacustrine, and marine deposits. Examples are sandstone, siltstone, mudstone, claystone, shale, conglomerate, limestone, dolomite, and coal.

Sequum. A sequence consisting of an illuvial horizon and the overlying eluvial horizon. (See Eluviation.)

Series, soil. A group of soils that have profiles that are almost alike, except for differences in texture of the surface layer. All the soils of a series have horizons that are similar in composition, thickness, and arrangement.

Shale. Sedimentary rock that formed as a result of the induration of a clay, silty clay, or silty clay loam deposit and has the tendency to split into thin layers (fissility).

Shallow soil. See Depth, soil.

Sheet erosion. The removal of a fairly uniform layer of soil material from the land surface by the action of rainfall and surface runoff.

Shoulder. The position that forms the uppermost inclined surface near the top of a hillslope. It is a transition from backslope to summit. The surface is dominantly convex in profile and erosional in origin.

Side slope. A geomorphic component of hills consisting of a laterally planar area of a hillside. The overland waterflow is predominantly parallel.

Silica. A combination of silicon and oxygen. The mineral form is called quartz.

Silica-sesquioxide ratio. The ratio of the number of molecules of silica to the number of molecules of alumina and iron oxide. The more highly weathered soils or their clay fractions in warm-temperate, humid regions, and especially those in the tropics, generally have a low ratio.

Silt. As a soil separate, individual mineral particles that range in diameter from the upper limit of clay (0.002 millimeter) to the lower limit of very fine sand (0.05 millimeter). As a soil textural class, soil that is 80 percent or more silt and less than 12 percent clay.

Siltstone. Sedimentary rock made up of dominantly silt-sized particles.

Similar soils. Soils that share limits of diagnostic criteria, behave and perform in a similar manner, and have similar conservation needs or management requirements for the major land uses in the survey area.

Site index. A designation of the quality of a forest site based on the height of the dominant stand at an arbitrarily chosen age. For example, if the average height attained by dominant and codominant trees in a fully stocked stand at the age of 50 years is 75 feet, the site index is 75.

Site index (pinyon and juniper). A designation of the quality of a pinyon or juniper stand based on the basal area in square feet when the stand averages 5 inches in diameter 1 foot above the ground. A site index of 50 means that the stand will have a basal area of 50 square feet.

Slope. The inclination of the land surface from the horizontal. Percentage of slope is the vertical distance divided by horizontal distance, then multiplied by 100. Thus, a slope of 20 percent is a drop of 20 feet in 100 feet of horizontal distance. In this survey, classes for simple slopes are as follows:

Nearly level.....	0 to 2 percent
Gently sloping.....	0 to 5 percent
Moderately sloping.....	5 to 9 percent
Strongly sloping.....	9 to 15 percent
Moderately steep.....	15 to 30 percent
Steep.....	30 to 50 percent
Very steep.....	50 percent and higher

Classes for complex slopes are as follows:

Nearly level.....	0 to 2 percent
Gently undulating.....	0 to 5 percent
Undulating.....	5 to 9 percent

Soil Survey of Redwood National and State Parks, California

Hilly	15 to 30 percent
Steep	30 to 50 percent
Very steep	50 percent and higher

Sodium adsorption ratio (SAR). A measure of the amount of sodium (Na) relative to calcium (Ca) and magnesium (Mg) in the water extract from saturated soil paste. It is the ratio of the Na concentration divided by the square root of one-half of the Ca + Mg concentration.

Soft bedrock. Bedrock that can be excavated with trenching machines, backhoes, small rippers, and other equipment commonly used in construction.

Soil. A natural, three-dimensional body at the earth's surface. It is capable of supporting plants and has properties resulting from the integrated effect of climate and living matter acting on earthy parent material, as conditioned by relief over periods of time.

Soil erodibility factors. The Kw and Kf factors quantify the susceptibility of soil to detachment by water. These erodibility factors predict the long-term average soil loss that results from sheet and rill erosion when various cropping systems and conservation techniques are used. The whole soil is considered in the Kw factor, but only the fine-earth fraction, which is the material less than 2 millimeters in diameter, is considered in the Kf factor.

Soil separates. Mineral particles less than 2 millimeters in equivalent diameter and ranging between specified size limits. The names and sizes, in millimeters, of separates recognized in the United States are as follows:

Very coarse sand	2.0 to 1.0
Coarse sand	1.0 to 0.5
Medium sand	0.5 to 0.25
Fine sand	0.25 to 0.10
Very fine sand	0.10 to 0.05
Silt	0.05 to 0.002
Clay	less than 0.002

Solum. The upper part of a soil profile, above the C horizon, in which the processes of soil formation are active. The solum in soil consists of the A, E, and B horizons. Generally, the characteristics of the material in these horizons are unlike those of the material below the solum. The living roots and plant and animal activities are largely confined to the solum.

Stone line. A sheetlike lag concentration of coarse fragments in surficial sediment. In cross section, the line may be marked only by scattered fragments or it may be a discrete layer of fragments. The fragments are more commonly pebbles or cobbles than stones. A stone line generally overlies material that was subject to weathering, soil formation, and erosion before deposition of the overlying material. Many stone lines appear to be buried erosion pavement originally formed by running water on the land surface and concurrently covered by surficial sediment.

Stones. Rock fragments 10 to 24 inches (25 to 60 centimeters) in diameter if rounded or 15 to 24 inches (38 to 60 centimeters) in length if flat.

Stony. Refers to a soil containing stones in numbers that interfere with or prevent tillage.

Stratified. Referring to geologic deposits that were formed, arranged, or laid down in layers. Layers in soils that are a result of the processes of soil formation are called horizons; those inherited from the parent material are called strata.

Stream terrace. One of a series of platforms in a stream valley that flanks and is more or less parallel to the stream channel, originally formed near the level of the stream, and represents the dissected remnants of an abandoned flood plain, streambed, or valley floor produced during an earlier period of erosion or deposition.

Strike-slip fault. A fault in which the movement is parallel to the strike of the fault surface.

- Stripcropping.** Growing crops in a systematic arrangement of strips or bands that provide vegetative barriers to wind erosion and water erosion.
- Structure, soil.** The arrangement of primary soil particles into compound particles or aggregates. The principal forms of soil structure are—*platy* (laminated), *prismatic* (vertical axis of aggregates longer than horizontal), *columnar* (prisms with rounded tops), *blocky* (angular or subangular), and *granular*. *Structureless* soils are either *single grained* (each grain by itself, as in dune sand) or *massive* (the particles adhering without any regular cleavage, as in many hardpans).
- Stubble mulch.** Stubble or other crop residue left on the soil or partly worked into the soil. It protects the soil from wind erosion and water erosion after harvest, during preparation of a seedbed for the next crop, and during the early growing period of the new crop.
- Subduction.** The sliding of the seafloor ocean plate beneath a continent or island arc plate.
- Subduction zone.** The elongate region in which subduction is occurring.
- Subsidence.** The decrease in surface elevation as a result of the drainage of wet soils that have organic layers or semifluid mineral layers.
- Subsoil.** Technically, the B horizon; roughly, the part of the solum below plow depth.
- Subsoiling.** Tilling a soil below normal plow depth, ordinarily to shatter a hardpan or claypan.
- Substratum.** The part of the soil below the solum.
- Subsurface layer.** Technically, the E horizon. Generally refers to a leached horizon lighter in color and lower in content of organic matter than the overlying surface layer.
- Summer fallow.** The tillage of uncropped land during the summer to control weeds and allow storage of moisture in the soil for the growth of a later crop. A practice common in semiarid regions, where annual precipitation is not enough to produce a crop every year. Summer fallow is frequently practiced before planting winter grain.
- Summit.** The topographically highest position of a hillslope. It has a nearly level (planar or only slightly convex) surface.
- Surface layer.** The soil ordinarily moved in tillage, or its equivalent in uncultivated soil, ranging in depth from 4 to 10 inches (10 to 25 centimeters). Frequently designated as the “plow layer,” or the “Ap horizon.”
- Surface soil.** The A, E, AB, and EB horizons, considered collectively. It includes all subdivisions of these horizons.
- Talus.** Rock fragments of any size or shape (commonly coarse and angular) at the base of a cliff or very steep rock slope; the accumulated mass of such loose, broken rock formed mainly by falling, rolling, or sliding.
- Taxadjuncts.** Soils that cannot be classified in a series recognized in the classification system. Such soils are named for a series they strongly resemble and are designated as taxadjuncts to that series because they differ in ways too small to be of consequence in interpreting their use and behavior. Soils are recognized as taxadjuncts only when one or more of their characteristics are slightly outside the range defined for the family of the series for which the soils are named.
- Temperature regime, soil.** A system that categorizes for taxonomic purposes general, long-term soil temperature conditions at the standard depth of 20 inches or at the surface of the bedrock, whichever is at a shallower depth. The various regimes are defined according to the freezing point of water or to the high and low extremes for significant biological activity. The regimes, which are defined in “Keys to Soil Taxonomy,” are as follows:
- Cryic.*—Soils that have a mean annual temperature of 32 to 47 degrees F and remain cold in summer.

Frigid.—Soils that have a mean annual temperature similar to that of the cryic regime but have a mean summer temperature at least 9 degrees warmer.

Isomesic.—Soils that have a mean annual soil temperature of 47 to 59 degrees F, and the difference between mean summer and mean winter temperature is less than 9 degrees F.

Mesic.—Soils that have a mean annual temperature of 47 to 59 degrees F, and the difference between the mean summer and mean winter temperature is more than 9 degrees.

Thermic.—Soils that have a mean annual temperature of 59 to 72 degrees F, and the difference between the mean summer and mean winter temperature is more than 9 degrees.

Terrace (conservation practice). An embankment, or ridge, constructed across sloping soils on the contour or at a slight angle to the contour. The terrace intercepts surface runoff so that water soaks into the soil or flows slowly to a prepared outlet. A terrace in a field generally is built so that the field can be farmed. A terrace intended mainly for drainage has a deep channel that is maintained in permanent sod.

Terrace (geologic). An old alluvial plain, ordinarily flat or undulating, bordering a river, a lake, or the sea.

Terrace (geomorphologic). A steplike surface bordering a valley floor or shoreline that represents the former position of a flood plain, lake, or seashore. The term is commonly applied to both the relatively flat summit surface (tread) that has been cut or built up by stream or wave action and the steeper descending slope (scarp or riser) that grades to a lower base level of erosion. Practically, terraces are considered to be generally flat alluvial areas above the 100-year flood stage.

Texture, soil. The relative proportions of sand, silt, and clay particles in a mass of soil. The basic textural classes, in order of increasing proportion of fine particles, are *sand, loamy sand, sandy loam, loam, silt loam, silt, sandy clay loam, clay loam, silty clay loam, sandy clay, silty clay,* and *clay*. The sand, loamy sand, and sandy loam classes may be further divided by specifying “coarse,” “fine,” or “very fine.”

Abbreviations for the texture terms are *C—clay, CL—clay loam, COS—coarse sand, COSL—coarse sandy loam, FS—fine sand, FSL—fine sandy loam, L—loam, LCOS—loamy coarse sand, LFS—loamy fine sand, LS—loamy sand, LVFS—loamy very fine sand, S—sand, SC—sandy clay, SCL—sandy clay loam, SI—silt, SIC—silty clay, SICL—silty clay loam, SIL—silt loam, SL—sandy loam, VFS—very fine sand, and VFSL—very fine sandy loam.*

Terms used in lieu of texture descriptions are *BR—bedrock, BY—boulders, CB—cobbles, CN—channers, FL—flagstones, G—gravel, HPM—highly decomposed plant material, MAT—material, MPM—moderately decomposed plant material, MUCK—muck, MPT—mucky peat, MUCK—muck, PBY—paraboulders, PCB—paracobbles, PCN—parachanners, PEAT—peat, PFY—paraflagstones, PG—paragravel, PST—parastones, SPM—slightly decomposed plant material, ST—stones, VAR—variable, and W—water.*

The texture modifiers that may apply to textural classes are *ASHY—ashy, BY—bouldery, BYV—very bouldery, BYX—extremely bouldery, CB—cobbly, CBV—very cobbly, CBX—extremely cobbly, CEM—cemented, CN—channery, CNV—very channery, CNX—extremely channery, COP—coprogenous, DIA—diatomaceous, FL—flaggy, FLV—very flaggy, FLX—extremely flaggy, GR—gravelly, GRC—coarse gravelly, GRF—fine gravelly, GRM—medium gravelly, GRV—very gravelly, GRX—extremely gravelly, GS—grassy, GYP—gypsiferous, HB—herbaceous, HYDR—hydrous, MEDL—medial, MK—mucky, MR—marly, MS—mossy, PBY—parabouldery, PBYV—very parabouldery, PBYX—extremely parabouldery, PCB—*

paracobbly, PCBV—very paracobbly, PCBX—extremely paracobbly, PCN—parachannery, PCNV—very parachannery, PCNX—extremely parachannery, PF—permanently frozen, PFY—paraflaggy, PFYV—very paraflaggy, PFYX—extremely paraflaggy, PG—paragravelly, PGV—very paragravelly, PGX—extremely paragravelly, PST—parastony, PSTV—very parastony, PSTX—extremely parastony, PT—peaty, ST—stony, STV—very stony, STX—extremely stony, and WD—woody.

T factor. The soil loss tolerance, which is defined as the maximum amount of erosion at which the quality of a soil as a medium for plant growth can be maintained.

Maintaining the quality of the soil includes maintaining the surface soil as a seedbed for plants, maintaining the atmosphere-soil interface to allow the entry of air and water into the soil and still protect the underlying soil from wind and water erosion, and maintaining the total soil volume as a reservoir for water and plant nutrients, which is preserved by minimizing soil loss.

Thermic temperature regime. See Temperature regime, soil.

Thrust fault. A fault in which the dip of the fault plane is at a low angle to the horizon.

Tilth, soil. The physical condition of the soil as related to tillage, seedbed preparation, seedling emergence, and root penetration.

Toeslope. The outermost inclined surface at the base of a hill; part of a footslope.

Topsoil. The upper part of the soil, which is the most favorable material for plant growth. It is ordinarily rich in organic matter and is used to topdress roadbanks, lawns, and land affected by mining.

Trace elements. Chemical elements, for example, zinc, cobalt, manganese, copper, and iron, in soils in extremely small amounts. They are essential to plant growth.

Udic moisture regime. See Moisture regime, soil.

Umbric epipedon. A thick, dark, humus-rich surface horizon (or horizons) that has low base saturation and pedogenic soil structure. It may include the upper part of the subsoil.

Unified soil classification. A system for classifying mineral and organic soils for engineering purposes based on particle-size characteristics, liquid limit, and plasticity index.

Upland (geomorphologic). A general term for the higher land of a region in contrast to the low-lying, adjacent land, such as a valley or plain; land at a higher elevation than the flood plain or low stream terrace; or land above the footslope zone of the hillslope continuum.

Valley fill. The unconsolidated sediment deposited by any agent (water, wind, ice, or mass wasting) that fills or partly fills a valley.

Variation. Refers to patterns of contrasting colors assumed to be inherited from the parent material rather than to be the result of poor drainage.

Vegetative cover. The crown cover of all live plants in relation to the ground surface.

Very deep soil. See Depth, soil.

Very shallow soil. See Depth, soil.

Water bars. Smooth, shallow ditches or depressional areas that are excavated at an angle across a sloping road. They are used to reduce the downward velocity of water and divert it off and away from the road surface. Water bars can easily be driven over if constructed properly.

Water table. The upper surface of ground water or the level below which the soil is saturated by water. Also, the top of an aquifer.

Weathering. All physical and chemical changes produced in rocks or other deposits at or near the earth's surface by atmospheric agents. These changes result in disintegration and decomposition of the material.

WEG. See Wind erodibility group.

Well graded. Refers to soil material consisting of coarse grained particles that are well distributed over a wide range in size or diameter. Such soil normally can be

easily increased in density and bearing properties by compaction. Contrasts with poorly graded soil.

Wilting point (or permanent wilting point). The moisture content of soil, on an oven-dry basis, at which a plant (specifically a sunflower) wilts so much that it does not recover when placed in a humid, dark chamber.

Wind erodibility group (WEG). A grouping of soils that have similar properties affecting their resistance to wind erosion in cultivated areas.

Windthrow. The uprooting and tipping over of trees by the wind.

Xeric moisture regime. See Moisture regime, soil.

*A growing degree day is a unit of heat available for plant growth. It can be calculated by adding the maximum and minimum daily temperatures, dividing the sum by 2, and subtracting the temperature below which growth is minimal for the principal crops in the area (40 degrees F).

Table 4.--Land Capability Classification

[Land capability is a system of grouping soils primarily on the basis of their capability to produce common cultivated crops and pasture plants without deteriorating over a long period of time. Values in the N column are for nonirrigated areas; the I column is for irrigated areas]

* The site index standard deviation provides a measure of the statistical dispersion of the plot site index data. The standard deviation is only given if there are three or more plots used to calculate the average site index.

Soil Survey of Redwood National and State Parks, California

Table 7a.--Forestland Management (Part 1)

[The information in this table indicates the dominant soil condition but does not eliminate the need for onsite investigation. The numbers in the value columns range from 0.01 to 1.00. The larger the value, the greater the limitation. See text for further explanation of ratings in this table]

Table 9.--Index of Common and Scientific Plant Names and Plant Symbols

[This table aids in correct plant identification and serves as a cross-reference to plant species listed in table 8. The plant synonymy matches the USDA-NRCS National PLANTS Database as of the time of publication]

Common local name	Scientific name	Plant symbol
Alaska oniongrass	Melica subulata	MESU
American dunegrass	Leymus mollis	LEMO8
annual lupine	Lupinus bicolor	LUBI
annual vernalgrass	Anthoxanthum aristatum	ANAR7
beach strawberry	Fragaria chiloensis	FRCH
beach tidytips	Layia carnosa	LACA4
beach wormwood	Artemisia pycnocephala	ARPY3
bedstraw	Galium spp.	GALIU
bentgrass	Agrostis spp.	AGROS2
bigleaf maple	Acer macrophyllum	ACMA3
blue wildrye	Elymus glaucus	ELGL
Brewer's rush	Juncus breweri	JUBR10
bristly dogstail grass	Cynosurus echinatus	CYEC
bush lupine	Lupinus arboreus	LUAR
buttercup	Ranunculus spp.	RANUN
California bay	Umbellularia californica	UMCA
California black oak	Quercus kelloggii	QUKE
California blackberry	Rubus ursinus	RUUR
California brome	Bromus carinatus	BRCA5
California buckthorn	Rhamnus californica	RHCA
California fescue	Festuca californica	FECA
California huckleberry	Vaccinium ovatum	VAOV2
California live oak	Quercus agrifolia	QUAG
California oatgrass	Danthonia californica	DACA3
California red huckleberry	Vaccinium parvifolium	VAPA
California wax myrtle	Morella californica	MOCA6
canyon live oak	Quercus chrysolepis	QUCH2
carex	Carex spp.	CAREX
Cascade barberry	Berberis nervosa	BENE2
cascara	Rhamnus purshiana	RHPU
chinquapin	Castanopsis spp.	CASTA2
coastal sand verbena	Abronia latifolia	ABLA2
common beargrass	Xerophyllum tenax	XETE
common snowberry	Symphoricarpos albus	SYAL
common velvetgrass	Holcus lanatus	HOLA
common whipplea	Whipplea modesta	WHMO
common yarrow	Achillea millefolium	ACMI2
cottonwood	Populus spp.	POPUL
coyotebrush	Baccharis pilularis	BAPI
creambush oceanspray	Holodiscus discolor	HODI
dandelion	Taraxacum spp.	TARAX
deer fern	Blechnum spicant	BLSP
dogtail	Cynosurus spp.	CYNOS2
Douglas-fir	Pseudotsuga menziesii	PSME
dune willow	Salix hookeriana	SAHO
European beachgrass	Ammophila arenaria	AMAR4
evergreen violet	Viola sempervirens	WISE3
fescue	Festuca spp.	FESTU
greenleaf manzanita	Arctostaphylos patula	ARPA6
hairy cat's ear	Hypochaeris radicata	HYRA3
hairy manzanita	Arctostaphylos columbiana	ARCO3
hemlock	Tsuga spp.	TSUGA
Himalaya blackberry	Rubus discolor	RUDI2
hooded ladies' tresses	Spiranthes romanzoffiana	SPRO
huckleberry oak	Quercus vacciniifolia	QUVA
Idaho fescue	Festuca idahoensis	FEID
Jeffrey pine	Pinus jeffreyi	PIJE
junegrass	Koeleria macrantha	KOMA

Soil Survey of Redwood National and State Parks, California

Table 9.--Index of Common and Scientific Plant Names and Plant Symbols--Continued

Common local name	Scientific name	Plant symbol
Kentucky bluegrass	<i>Poa pratensis</i>	POPR
knobcone pine	<i>Pinus attenuata</i>	PIAT
larkspur	<i>Delphinium</i> spp.	DELPH
lupine	<i>Lupinus</i> spp.	LUPIN
Mt. Albert goldenrod	<i>Solidago simplex</i> ssp. <i>simplex</i> var. <i>spatulata</i>	SOSIS4
orchardgrass	<i>Dactylis glomerata</i>	DAGL
Oregon white oak	<i>Quercus garryana</i>	QUGA4
other annual forbs	unknown	AAFF
other annual grasses	unknown	AAGG
other perennial forbs	unknown	PPFF
other perennial grasses	unknown	PPGG
Pacific madrone	<i>Arbutus menziesii</i>	ARME
Pacific rhododendron	<i>Rhododendron macrophyllum</i>	RHMA3
Pacific trillium	<i>Trillium ovatum</i>	TROV2
pale flax	<i>Linum bienne</i>	LIBI5
phacelia	<i>Phacelia</i> spp.	PHACE
pinemat manzanita	<i>Arctostaphylos nevadensis</i>	ARNE
pink sand verbena	<i>Abronia umbellata</i>	ABUM
plantain	<i>Plantago</i> spp.	PLANT
Port Orford cedar	<i>Chamaecyparis lawsoniana</i>	CHLA
rattail fescue	<i>Vulpia myuros</i>	VUMY
red alder	<i>Alnus rubra</i>	ALRU2
redwood	<i>Sequoia sempervirens</i>	SESE3
redwood-sorrel	<i>Oxalis oregana</i>	OXOR
ripgut brome	<i>Bromus diandrus</i>	BRDI3
rose	<i>Rosa</i> spp.	ROSA5
rush	<i>Juncus</i> spp.	JUNCU
ryegrass	<i>Lolium</i> spp.	LOLIU
salal	<i>Gaultheria shallon</i>	GASH
salmonberry	<i>Rubus spectabilis</i>	RUSP
sanicle	<i>Sanicula</i> spp.	SANIC
Scotch broom	<i>Cytisus scoparius</i>	CYSC4
sheep sorrel	<i>Rumex acetosella</i>	RUAC3
shore pine	<i>Pinus contorta</i> ssp. <i>contorta</i>	PICOC
Sierra gooseberry	<i>Ribes roezlii</i>	RIRO
silver hairgrass	<i>Aira caryophyllea</i>	AICA
silverweed cinquefoil	<i>Argentina anserina</i>	ARAN7
Sitka spruce	<i>Picea sitchensis</i>	PISI
skunkcabbage	<i>Lysichiton</i> spp.	LYSIC
Slough sedge	<i>Carex obnupta</i>	CAOB3
soft brome	<i>Bromus hordeaceus</i>	BRHO2
soft chess	<i>Bromus hordeaceus</i> ssp. <i>hordeaceus</i>	BRHOH
Spanish lotus	<i>Lotus purshianus</i>	LOPU3
spikerush	<i>Eleocharis</i> spp.	ELEOC
stink currant	<i>Ribes bracteosum</i>	RIBR
sumac	<i>Rhus</i> spp.	RHUS
sweet vernalgrass	<i>Anthoxanthum odoratum</i>	ANOD
tall oatgrass	<i>Arrhenatherum elatius</i>	AREL3
tanoak	<i>Lithocarpus densiflorus</i>	LIDE3
thistle	<i>Cirsium</i> spp.	CIRSI
timothy	<i>Phleum pratense</i>	PHPR3
trefoil	<i>Lotus</i> spp.	LOTUS
vetch	<i>Vicia</i> spp.	VICIA
western brackenfern	<i>Pteridium aquilinum</i>	PTAQ
western hemlock	<i>Tsuga heterophylla</i>	TSHE
western swordfern	<i>Polystichum munitum</i>	POMU
western thimbleberry	<i>Rubus parviflorus</i>	RUPA
wild pea	<i>Lathyrus</i> spp.	LATHY
willow	<i>Salix</i> spp.	SALIX
yarrow	<i>Achillea</i> spp.	ACHIL

Table 10a.--Recreational Development (Part 1)

[The information in this table is based on interpretations developed by the Pacific Southwest MLRA Office. The information indicates the dominant soil condition but does not eliminate the need for onsite investigation. The numbers in the value columns range from 0.01 to 1.00. The larger the value, the greater the potential limitation. The rating is based on the limitation with the highest value. Only the three highest-value limitations are listed. There may be more limitations. Fine-earth fractions and coarse fragments are reported on the basis of weight. An explanation of the rating criteria and of the abbreviations used in describing the limitations is given at the end of the table]

Map symbol and soil name	Pct. of map unit	Camp areas		Picnic areas		Playgrounds

The interpretation for camp areas evaluates the following soil properties at varying depths in the soil: flooding; ponding; wetness; slope; depth to bedrock; depth to a cemented pan; fragments less than, equal to, or greater than 3 inches in size; sodium content (SAR); salinity (EC); a clayey surface texture; Unified classes for a high content of organic matter (PT, OL, and OH); soil dustiness; and permeability (Ksat) that is too high, allowing seepage in some climates.

The interpretation for picnic areas evaluates the following soil properties at varying depths in the soil: flooding, ponding, wetness, slope, depth to bedrock, depth to a cemented pan, salinity (EC), pH, soil dustiness, fragments greater than 3 inches in size, the amount of sand or clay in the surface layer layer, surface fragments greater than 10 inches in size, Unified classes for a high content of organic matter (PT, OL, and OH), and permeability (Ksat) that is too high, allowing seepage in some climates.

The interpretation for playgrounds evaluates the following soil properties at varying depths in the soil: flooding, ponding, wetness, slope, depth to bedrock, depth to a cemented pan, surface fragments greater than 10 inches in size, fragments equal to or less than 3 inches in size, Unified class for high content of organic matter (PT, OL, and OH), soil dustiness, content of sand or clay in the surface layer, pH, salinity (EC), and permeability (Ksat) that is too high, allowing seepage in some climates.

Table 10b.--Recreational Development (Part 2)

[The information in this table is based on interpretations developed by the Pacific Southwest MLRA Office. The information indicates the dominant soil condition but does not eliminate the need for onsite investigation. The numbers in the value columns range from 0.01 to 1.00. The larger the value, the greater the potential limitation. The rating is based on the limitation with the highest value. Only the three highest-value limitations are listed. There may be more limitations. Fine-earth fractions and coarse fragments are reported on the basis of weight. An explanation of the rating criteria and of the abbreviations used in describing the limitations is given at the end of the table]

The interpretation for paths and trails evaluates the following soil properties at varying depths in the soil: flooding; ponding; wetness; slope; fragments less than, equal to, or greater than 3 inches in size; the content of clay and sand in surface layer; surface fragments greater than or equal to 10 inches in size; Unified classes for a high content of organic matter (PT, OL, and OH); soil dustiness; and the susceptibility of the soil to erosion by water.

The interpretation for off-road motorcycle trails evaluates the following soil properties at varying depths in the soil: flooding; ponding; wetness; slope; soil dustiness; fragments greater than, equal to or greater than 3 inches in size; sand or clay content in the surface layer; and Unified classes for a high content of organic matter (PT, OL, and OH).

The interpretation for lawns, landscaping, and golf fairways evaluates the following soil properties at varying depths in the soil: flooding; ponding; wetness; slope; depth to bedrock; depth to a cemented pan; fragments greater than, equal to, or less than 3 inches in size; surface fragments greater than or equal to 10 inches in size; Unified class for high content of organic matter (PT, OL, and OH); soil dustiness; sand or clay content in the surface layer; pH; salinity (EC); sodium content (SAR); calcium carbonates; and sulfur content.

Table 11a.--Building Site Development (Part 1)

[The information in this table is based on interpretations developed by the Pacific Southwest MLRA Office. The information indicates the dominant soil condition but does not eliminate the need for onsite investigation. The numbers in the value columns range from 0.01 to 1.00. The larger the value, the greater the potential limitation. The rating is based on the limitation with the highest value. Only the three highest-value limitations are listed. There may be more limitations. Fine-earth fractions and coarse fragments are reported on the basis of weight. An explanation of the rating criteria and of the abbreviations used in describing the limitations is given at the end of the table]

Map symbol and soil name	Pct. of map unit	Dwellings without basements		Dwellings with basements		Small commercial buildings

618

Soil Survey of Redwood National and State Parks, California

The interpretation for dwellings without basements evaluates the following soil properties at varying depths in the soil: flooding, ponding, wetness, slope, subsidence of organic soils, shrink-swell potential expressed as linear extensibility percent (LEP), organic Unified classes for low soil strength (PT, OL, and OH), depth to hard or soft bedrock, depth to a thick or thin cemented pan, and fragments greater than 3 inches in size.

The interpretation for dwellings with basements evaluates the following soil properties at varying depths in the soil: flooding, ponding, wetness, slope, subsidence of organic soils, shrink-swell potential expressed as linear extensibility percent (LEP), organic Unified classes for low strength (PT, OL, and OH), depth to hard or soft bedrock, depth to a thick or thin cemented pan, and fragments greater than 3 inches in size.

The interpretation for small commercial buildings evaluates the following soil properties at varying depths in the soil: flooding, ponding, wetness, slope, subsidence of organic soils, shrink-swell potential expressed as linear extensibility percent (LEP), depth to hard or soft bedrock, depth to a thick or thin cemented pan, and fragments greater than 3 inches in size.

Table 11b.--Building Site Development (Part 2)

[The information in this table is based on interpretations developed by the Pacific Southwest MLRA Office. The information indicates the dominant soil condition but does not eliminate the need for onsite investigation. The numbers in the value columns range from 0.01 to 1.00. The larger the value, the greater the potential limitation. The rating is based on the limitation with the highest value. Only the three highest-value limitations are listed. There may be more limitations. Fine-earth fractions and coarse fragments are reported on the basis of weight. An explanation of the rating criteria and of the abbreviations used in describing the limitations is given at the end of the table]

Map symbol and soil name	Pct. of map unit	Local roads and streets		Shallow excavations	
		Limitation	Value	Limitation	Value
100: Riverwash-----	90	Limitations Flooding >= occasional Saturation from 12 to 30" depth	1.00 0.60	Limitations Saturation < 2.5' depth Caving potential Frequent or occasional flooding	1.00 1.00 0.50

The interpretation for local roads and streets evaluates the following soil properties at varying depths in the soil: flooding, ponding, wetness, slope, organic Unified classes for low soil strength (PT, OL, and OH), amount of clay, depth to hard or soft bedrock, depth to a thick or thin cemented pan, fragments greater than 3 inches in size, soil bulk density, and the potential of the soil to cave.

The interpretation for shallow excavation evaluates the following soil properties at varying depths in the soil: flooding, ponding, wetness, slope, subsidence of organic soils, shrink-swell potential expressed as linear extensibility percent (LEP), potential frost action, depth to hard or soft bedrock, depth to a thick or thin cemented pan, fragments greater than 3 inches in size, and soil strength expressed as an AASHTO group index number (AASHTO GI).

Table 12a.--Sanitary Facilities (Part 1)

[The information in this table is based on interpretations developed by the Pacific Southwest MLRA Office. The information indicates the dominant soil condition but does not eliminate the need for onsite investigation. The numbers in the value columns range from 0.01 to 1.00. The larger the value, the greater the potential limitation. The rating is based on the limitation with the highest value. Only the three highest-value limitations are listed. There may be more limitations. Fine-earth fractions and coarse fragments are reported on the basis of weight. An explanation of the rating criteria and of the abbreviations used in describing the limitations is given at the end of the table]

Map symbol and soil name	Pct. of map unit	Septic tank absorption fields		Sewage lagoons	
		Limitation	Value	Limitation	Value
100: Riverwash-----	90	Limitations Flooding Saturation < 4' depth Permeability > 6"/hr in 24-60" (seepage and poor filter)	1.00 1.00 1.00	Limitations Flooding >= occasional Permeability > 2"/hr (seepage) Fragments (>3") 20-35%	1.00 1.00 0.68

Walnett, extremely stony-----	25	Limitations Slopes > 15% Permeability < .6"/hr in 24-60" (slow perc) Fragments (>3") 25 to 50%	1.00 1.00 0.53	Limitations Slopes > 8% Fragments (>3") > 35%	1.00 1.00
Jayel-----	20	Limitations Depth to bedrock < 40" Slopes > 15%	1.00 1.00	Limitations Bedrock (hard) < 40" depth Slopes > 8%	1.00 1.00

The interpretation for septic tank absorption fields evaluates the following soil properties at varying depths in the soil: flooding; ponding; wetness; slope; subsidence of organic soils; depth to hard or soft bedrock; depth to a cemented pan; permeability that is too fast, allowing seepage; permeability that is too slow; and an impermeable layer at a shallow depth.

The interpretation for sewage lagoons evaluates the following soil properties at varying depths in the soil: flooding, ponding, wetness, slope, organic Unified classes for low strength (PT, OL, and OH), depth to hard or soft bedrock, depth to a cemented pan, fragments greater than 3 inches in size, and permeability that is too fast, allowing seepage.

Table 12b.--Sanitary Facilities (Part 2)

[The information in this table is based on interpretations developed by the Pacific Southwest MLRA Office. The information indicates the dominant soil condition but does not eliminate the need for onsite investigation. The numbers in the value columns range from 0.01 to 1.00. The larger the value, the greater the potential limitation. The rating is based on the limitation with the highest value. Only the three highest-value limitations are listed. There may be more limitations. Fine-earth fractions and coarse fragments are reported on the basis of weight. An explanation of the rating criteria and of the abbreviations used in describing the limitations is given at the end of the table]

Map symbol and soil name	Pct. of map unit	Trench type sanitary landfill		Area type sanitary landfill		Daily cover for landfill	
		Limitation	Value	Limitation	Value	Limitation	Value
100: Riverwash-----	90	Not rated		Not rated		Not rated	
102: Fluents-----	75	Limitations Flooding >= occasional Saturation < 6' depth Seepage in bottom layer	1.00 1.00 1.00	Limitations Saturation < 5' depth Seepage in 20-40" depth Frequent flooding	1.00 1.00 0.80	Limitations Ponded (any duration) Texture is s, fs, cos, sg	1.00 1.00

Abbreviations for textures: cos, coarse sand; cosl, coarse sandy loam; fs, fine sand; lcos, loamy coarse sand; lfs, loamy fine sand; ls, loamy sand; lvfs loamy very fine sand; s, sand; sg, sand and gravel; and vfs, very fine sand.

The interpretation for trench sanitary landfills evaluates the following soil properties at varying depths in the soil: flooding, ponding, wetness, slope, depth to hard or soft bedrock, depth to a thick or thin cemented pan, fragments 3 to 10 inches in size, sodium content (SAR), pH, clayey or sandy textures, and permeability that is too high, allowing seepage in some climates.

The interpretation for area sanitary landfills evaluates the following soil properties at varying depths in the soil: flooding, ponding, wetness, slope, depth to bedrock, depth to a cemented pan, and permeability that is too high, allowing seepage in some climates.

The interpretation for daily cover for landfill evaluates the following soil properties at varying depths in the soil: ponding, wetness, slope, depth to bedrock, depth to a cemented pan, fragments greater than or less than 3 inches in size, Unified class for peat (PT), Unified classes for packing (OL, OH, CH, and MH), sandy or clayey textures, pH, carbonates, sodium content (SAR), salinity (EC), soil climate, kaolinitic mineralogy, and permeability that is too high, allowing seepage.

Table 13a.--Construction Materials (Part 1)

[The information in this table is based on interpretations developed by the Pacific Southwest MLRA Office. The information indicates the dominant soil condition but does not eliminate the need for onsite investigation. The numbers in the value columns range from 0.00 to 0.99. The closer the value is to 0, the greater the potential limitation. Values of 0 are absolute limitations based on the soil property criteria used to develop the interpretation. Values closer to 1.0 have less of a limitation. Limiting features with values equal to 1.0 have absolutely no limitation. Rating classes are determined by the most limiting value. Fine-earth fractions and fragment limiting features are reported on the basis of weight. A brief summary of the rating criteria and of the abbreviations used in the describing the limitations is given at the end of the table]

Map symbol and soil name	Pct. of map unit	Potential source of gravel		Potential source of sand		Potential source of topsoil

The interpretation for gravel source evaluates coarse fragments greater than 0.2 inches in size in the bottom layer or in the thickest layer of the soil.

The interpretation for sand source evaluates the amount of sand and fine gravel in the thickest layer or in the bottom layer of the soil. Organic soil layers that have the Unified engineering class for peat (PT) are also evaluated.

The interpretation for topsoil source evaluates the following soil properties at varying depths: calcium carbonate content, clay content, soil bulk density, sand content, soil wetness, coarse fragments 0.2 to 3 inches in size, fragments greater than 3 inches in size, content of organic matter (OM), sodium content expressed as the sodium adsorption ratio (SAR), salinity expressed as dS/m of electrical conductivity (EC), depth to bedrock, slope, and pH.

Table 13b.--Construction Materials (Part 2)

[The information in this table is based on interpretations developed by the Pacific Southwest MLRA Office. The information indicates the dominant soil condition but does not eliminate the need for onsite investigation. The numbers in the value columns range from 0.00 to 0.99. The closer the value is to 0, the greater the potential limitation. Values of 0 are absolute limitations based on the soil property criteria used to develop the interpretation. Values closer to 1.0 have less of a limitation. Limiting features with values equal to 1.0 have absolutely no limitation and are not shown in this report. Rating classes are determined by the most limiting value. Fine-earth fractions and fragment limiting features are reported on the basis of weight. A brief summary of the rating criteria and of the abbreviations used in the describing the limitations is given at the end of the table]

The interpretation for reclamation material source evaluates the following soil properties at varying depths in the soil: the content of sand, clay, fragments, and organic matter (OM); the wind erodibility group (WEG); available water capacity (AWC); pH; salinity (EC); amount of sodium (SAR); carbonates; and the susceptibility of the soil to erosion by water (K-factor).

The interpretation for roadfill source evaluates the following soil properties at varying depths in the soil: shrink-swell potential expressed as linear extensibility percent (LEP), depth to rock or a cemented pan, wetness, slope, soil strength expressed as AASHTO Group Index (AASHTO GI), and content of rock fragments.

Soil Survey of Redwood National and State Parks, California

Table 14.--Water Management

[The information in this table is based on interpretations developed by the Pacific Southwest MLRA Office. The information indicates the dominant soil condition but does not eliminate the need for onsite investigation. The numbers in the value columns range from 0.01 to 1.00. The larger the value, the greater the potential limitation. The rating is based on the limitation with the highest value. Only the three highest-value limitations are listed. There may be more limitations. Fine-earth fractions and coarse fragments are reported on the basis of weight. An explanation of the rating criteria and of the abbreviations used in describing the limitations is given at the end of the table]

		Thin layer	0.81	Slopes > 7%	1.00
		Shrink-swell (LEP 3-6)	0.50	Depth to bedrock from 20-60"	0.81
		MH or CH Unified; PI <40%	0.50		

The interpretation for embankments, dikes, and levees evaluates the following soil properties at varying depths in the soil: ponding; wetness; depth to a restrictive layer; fragments greater than 3 inches in size; salinity (EC); Unified classes for high content of organic matter (PT, OL, and OH); Unified classes that are hard to pack (MH and CH); permeability that is too high, allowing seepage; piping as determined by Atterberg limits of liquid limit (LL) and plasticity index (PI); sodium content (SAR); and gypsum content.

The interpretation for pond reservoir areas evaluates the following soil properties at varying depths in the soil: slope, depth to hard or soft bedrock, depth to a cemented pan, marly textures, gypsum content, and permeability that is too high, allowing seepage.

Table 22.--Taxonomic Classification of the Soils

[An asterisk in the first column indicates a taxadjunct to the series. See text for a description of those characteristics that are outside the range of the series]

Soil name	Family or higher taxonomic class
Ahpah	Fine-loamy, mixed, active, isomesic Typic Dystrudepts
Airstrip	Loamy-skeletal, mixed, superactive, mesic Humic Dystruxerepts
*Airstrip	Loamy-skeletal, mixed, superactive, isomesic Humic Dystrudepts
Arlynda	Fine-silty, mixed, superactive, nonacid, isomesic Fluvaquentic Endoaquepts
*Arlynda	Fine-loamy, mixed, superactive, nonacid, isomesic Fluvaquentic Endoaquepts
Atwell	Fine, mixed, active, isomesic Oxyaquic Hapludalfs
Aubell	Fine, mixed, active, mesic Oxyaquic Dystrudepts
Battery	Fine-loamy, mixed, semiactive, isomesic Typic Palehumults
*Battery	Fine-loamy, mixed, semiactive, isomesic Ustic Palehumults
Bigriver	Coarse-loamy, mixed, superactive, nonacid, isomesic Typic Udifluvents
Bigtree	Fine-loamy, isotic, isomesic Andic Dystrudepts
Catchings	Loamy-skeletal, mixed, semiactive, isomesic Typic Haplohumults
Childshill	Fine-loamy, mixed, semiactive, isomesic Ustic Palehumults
Clambeach	Mixed, isomesic Typic Psammaquents
Coppercreek	Fine-loamy, mixed, semiactive, isomesic Typic Palehumults
Countshill	Fine-loamy, mixed, superactive, mesic Humic Dystruxerepts
*Countshill	Fine-loamy, mixed, superactive, isomesic Humic Dystrudepts
Coyoterock	Fine, mixed, active, mesic Ultic Haploxeralfs
Darkwoods	Loamy-skeletal, mixed, active, mesic Typic Haploxerults
Devilscreek	Fine-loamy, mixed, semiactive, isomesic Oxyaquic Dystrudepts
Dolason	Fine-loamy, mixed, superactive, mesic Humic Dystruxerepts
*Dolason	Fine-loamy, mixed, superactive, isomesic Humic Pachic Dystrudepts
Doolyville	Fine-loamy, mixed, superactive, mesic Aquultic Haploxeralfs
Elkcamp	Fine-loamy, mixed, superactive, mesic Ultic Palexeralfs
Espa	Fine-loamy, mixed, superactive, isomesic Typic Haplohumults
Ferndale	Fine-silty, mixed, superactive, nonacid, mesic Typic Udifluvents
*Ferndale	Fine-loamy, mixed, superactive, mesic Oxyaquic Dystrudepts
*Ferndale	Fine-silty, mixed, superactive, nonacid, mesic Oxyaquic Udifluvents
Flintrock	Loamy-skeletal, mixed, superactive, isomesic Typic Hapludolls
Fluvents	Isomesic Fluvents
Footstep	Loamy-skeletal, mixed, superactive, isomesic Typic Haplohumults
Fortyfour	Fine, parasesquic, isomesic Typic Hapludults
*Fortyfour	Fine, parasesquic, isomesic Typic Haplults
Gasquet	Fine, parasesquic, mesic Typic Haploxerults
Goldbluffs	Loamy-skeletal, isotic, isomesic Typic Dystrudepts
Highoaks	Fine-loamy, mixed, superactive, mesic Xeric Palehumults
Highprairie	Fine-loamy, mixed, superactive, isomesic Pachic Hapludolls
Houda	Loamy-skeletal, mixed, superactive, isomesic Oxyaquic Eutrudepts
Jayel	Fine, parasesquic, mesic Typic Dystruxerepts
Lackscreek	Loamy-skeletal, mixed, active, isomesic Typic Haplohumults
Ladybird	Fine-loamy, mixed, superactive, isomesic Typic Haplohumults
Loleta	Fine-loamy, mixed, superactive, isomesic Fluvaquentic Endoaquolls
Maneze	Loamy-skeletal, mixed, superactive, mesic Humic Dystruxerepts
Mettah	Fine, parasesquic, isomesic Andic Palehumults
Mooncreek	Fine-loamy, mixed, active, mesic Typic Palexerults
Mudhorse	Fine-loamy, mixed, active, mesic Oxyaquic Palehumults
Mystery	Coarse-loamy, mixed, superactive, isomesic Oxyaquic Eutrudepts
Noisy	Loamy-skeletal, mixed, active, mesic Typic Haploxerults
Oakside	Loamy-skeletal, mixed, superactive, mesic Lithic Haploxerolls
Oragran	Loamy, magnesian, mesic Lithic Haploxerepts
Ossagon	Fine-loamy, mixed, superactive, isomesic Typic Haplohumults
Panthercreek	Loamy-skeletal, mixed, semiactive, isomesic Typic Eutrudepts
Pasturerock	Fine-loamy, mixed, active, mesic Ultic Haploxeralfs
Pigpen	Loamy-skeletal, mixed, superactive, thermic Aquultic Haploxeralfs
Pittplace	Fine, mixed, semiactive, isomesic Ustic Palehumults
Raingage	Fine-loamy, mixed, superactive, thermic Aquultic Haploxeralfs
Rockysaddle	Loamy-skeletal, mixed, semiactive, isomesic Ustic Palehumults
Rodgerpeak	Loamy, mixed, active, isomesic Lithic Dystrustepts
Russ	Coarse-loamy, mixed, superactive, nonacid, mesic Typic Udifluvents
Samoa	Mixed, mesic Typic Udipsamments

Soil Survey of Redwood National and State Parks, California

Table 22.--Taxonomic Classification of the Soils--Continued

Soil name	Family or higher taxonomic class
Sasquatch	Fine-loamy, mixed, superactive, isomesic Typic Palehumults
Scaath	Loamy-skeletal, mixed, active, isomesic Ustic Haplohumults
Sidehill	Loamy-skeletal, mixed, superactive, mesic Humic Dystraxepts
Sisterrocks	Loamy-skeletal, mixed, superactive, isomesic Typic Palehumults
Slidecreek	Loamy-skeletal, mixed, semiactive, isomesic Typic Palehumults
Squashan	Loamy-skeletal, isotic, isomesic Typic Haplohumults
Stonehill	Fine-loamy, mixed, superactive, isomesic Typic Haplohumults
Surpur	Fine-loamy, mixed, semiactive, isomesic Typic Haplohumults
*Surpur	Fine-loamy, mixed, semiactive, isomesic Ustic Haplohumults
Swainslough	Fine, mixed, superactive, nonacid, isomesic Fluvaquentic Endoaquepts
Talawa	Coarse-loamy, mixed, superactive, isomesic Oxyaquic Dystraxepts
Tarquin	Fine-loamy, mixed, superactive, isomesic Oxyaquic Palehumults
Tectah	Fine, mixed, semiactive, isomesic Typic Palehumults
Tossup	Fine, mixed, semiactive, mesic Typic Palexerults
Trailhead	Fine, parasesquic, isomesic Typic Palehumults
*Trailhead	Fine, parasesquic, isomesic Ustic Palehumults
Tsunami	Fine-loamy, mixed, superactive, isomesic Fluventic Humic Dystraxepts
Ustic Palehumults	Loamy-skeletal, mixed, semiactive, isomesic Ustic Palehumults
Walnett	Loamy-skeletal, parasesquic, mesic Ultic Haploxeralfs
Weitchpec	Loamy-skeletal, magnesian, mesic Typic Haploxerepts
Weott	Fine-silty, mixed, superactive, nonacid, isomesic Fluvaquentic Endoaquepts
Wiregrass	Fine-loamy, mixed, semiactive, isomesic Ustic Palehumults
Worswick	Coarse-loamy, mixed, superactive, nonacid, isomesic Fluvaquentic Endoaquepts
Yeti	Fine, mixed, superactive, isomesic Typic Palehumults

NRCS Accessibility Statement

The Natural Resources Conservation Service (NRCS) is committed to making its information accessible to all of its customers and employees. If you are experiencing accessibility issues and need assistance, please contact our Helpdesk by phone at 1-800-457-3642 or by e-mail at ServiceDesk-FTC@ftc.usda.gov. For assistance with publications that include maps, graphs, or similar forms of information, you may also wish to contact our State or local office. You can locate the correct office and phone number at <http://offices.sc.egov.usda.gov/locator/app>.
